the different types of Inflammation

Acute

Redness
Heat
Swelling
Obvious & immediate reactions

Resolution

Chronic

Sympoms not always obvious
Persistent pain (not "sharp", rather are dull)
Fatigue
Headaches
Gut distrubances
Brain Fog

If not managed:
Chronic disease development
Autoimmune disease

CHEWS food WISELY

Clinical Features

The 5 ancient cardinal signs of inflammation are

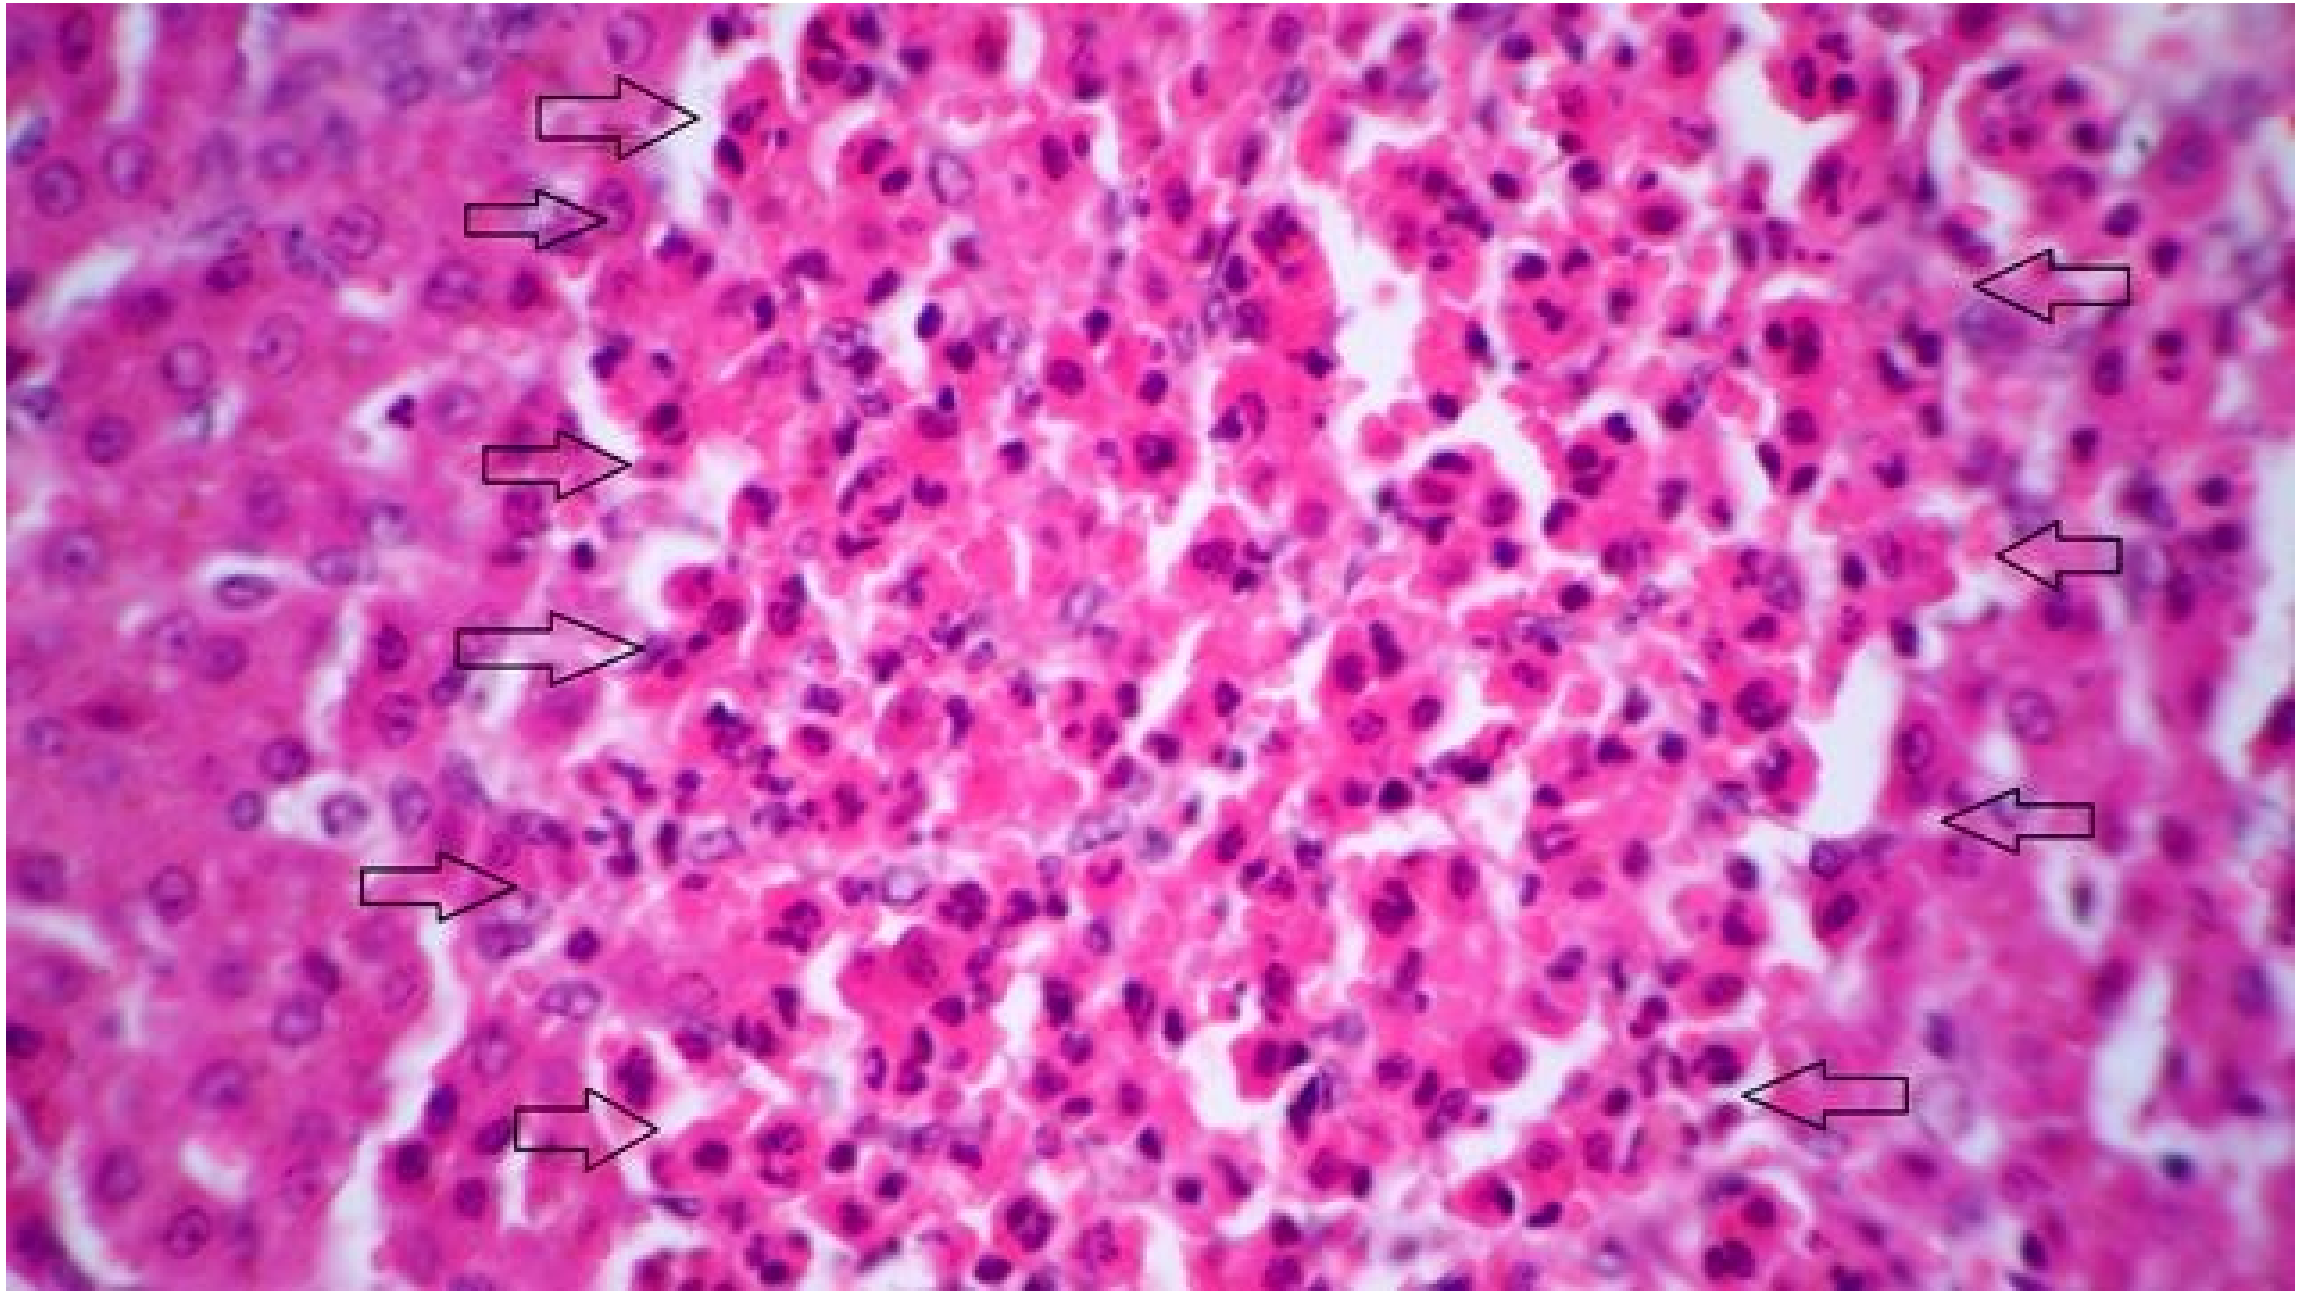

Tumor:-swelling

Rubor :– redness

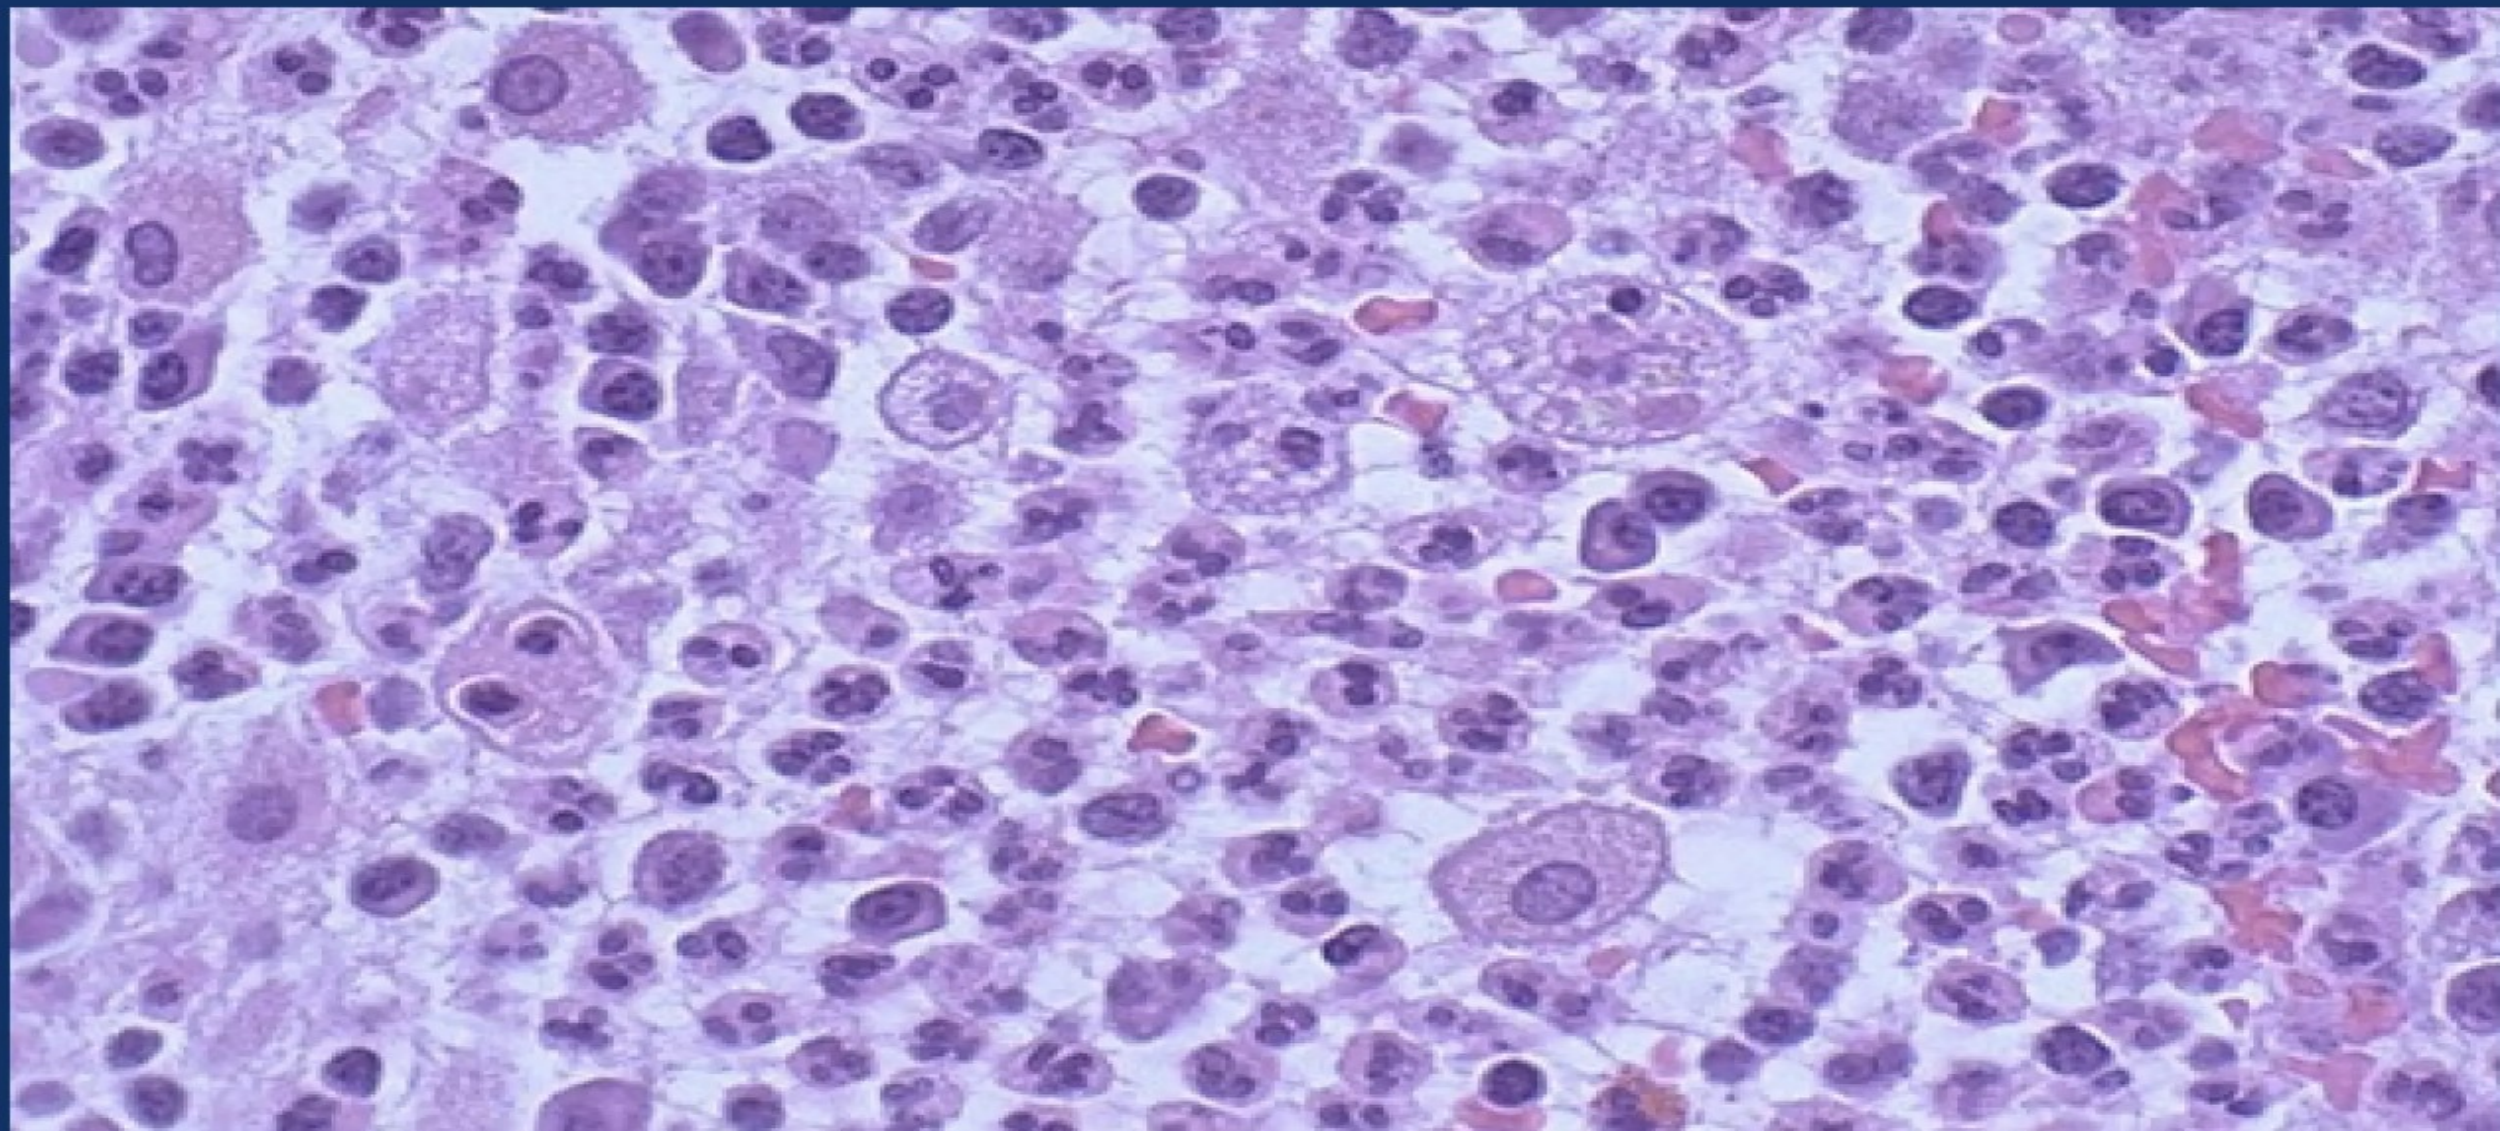

Calor: – warmth

Dolor :– pain

Functio Laesa :– loss of function

INFLAMMATORY CELLS

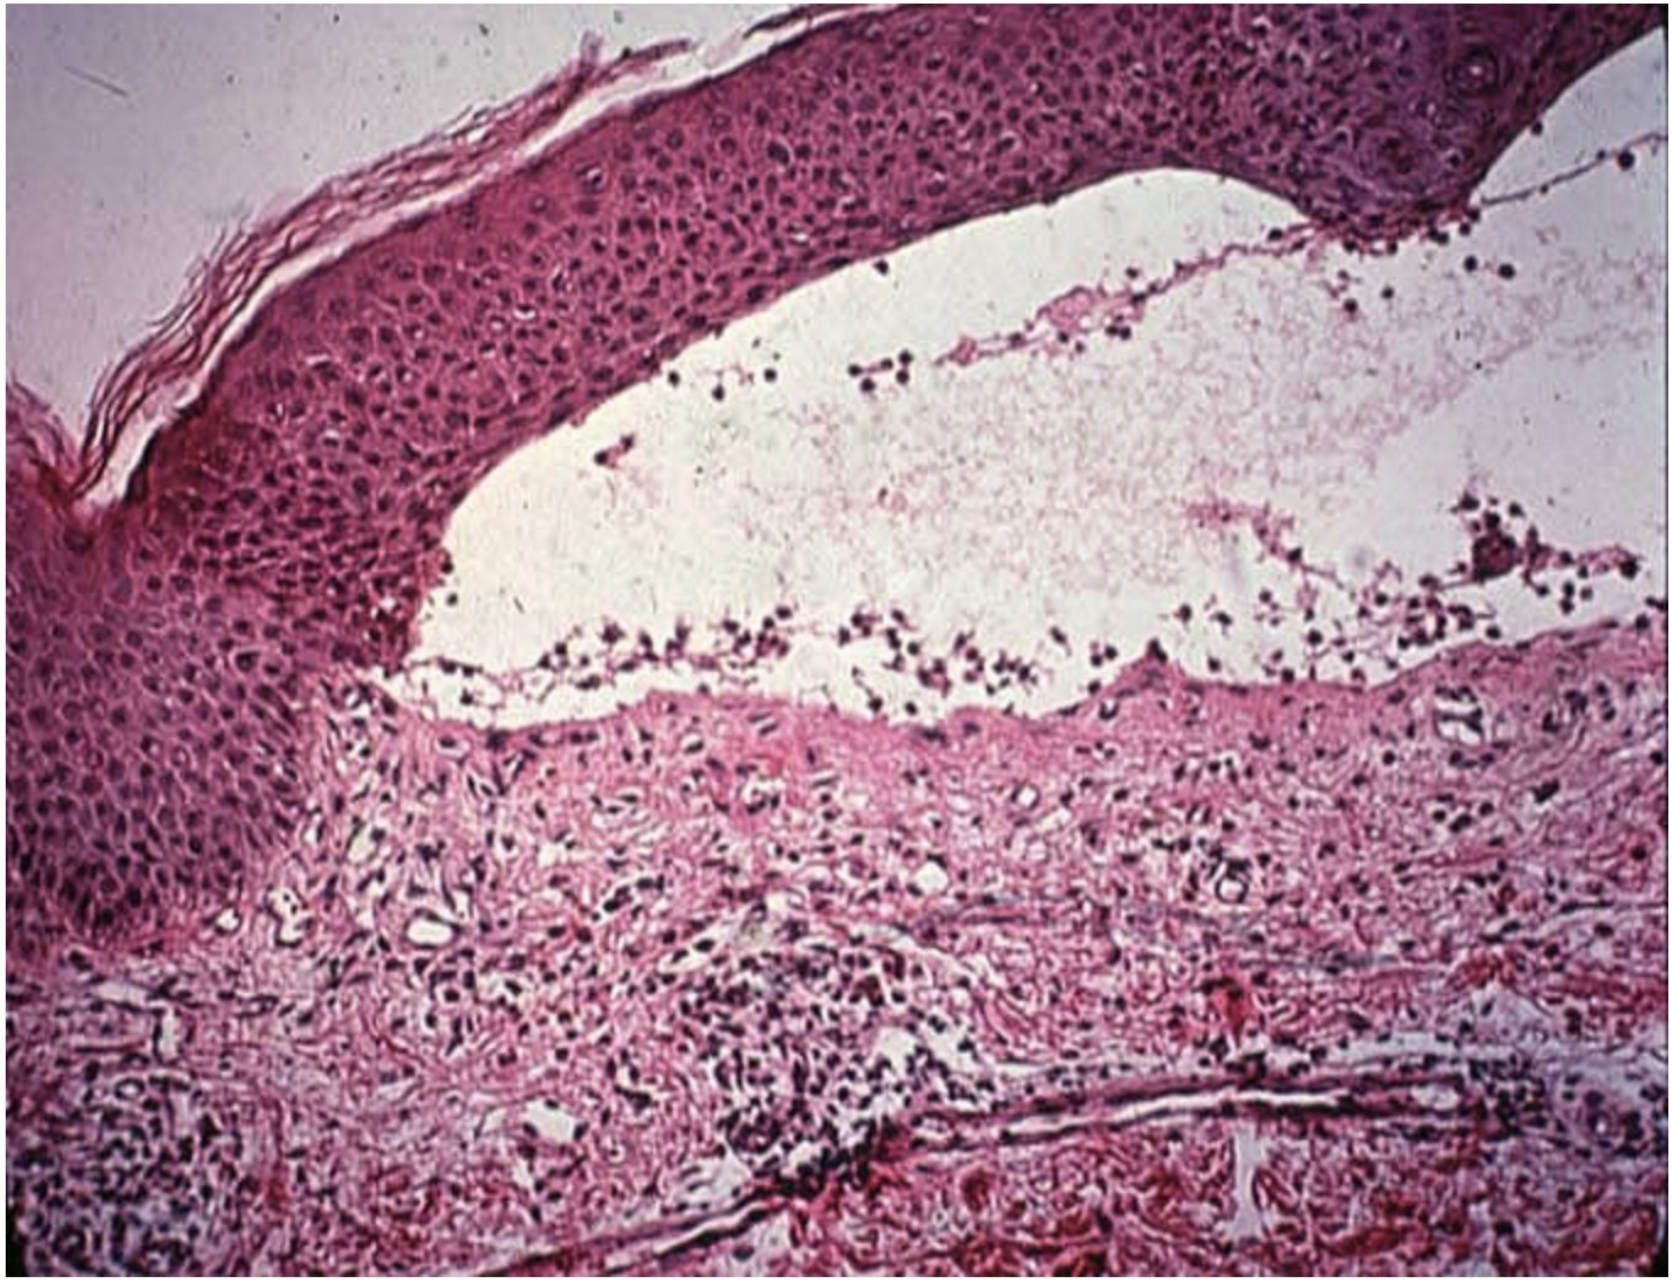

- What are the morphologic pattern of acute inflammation

Serous inflammation

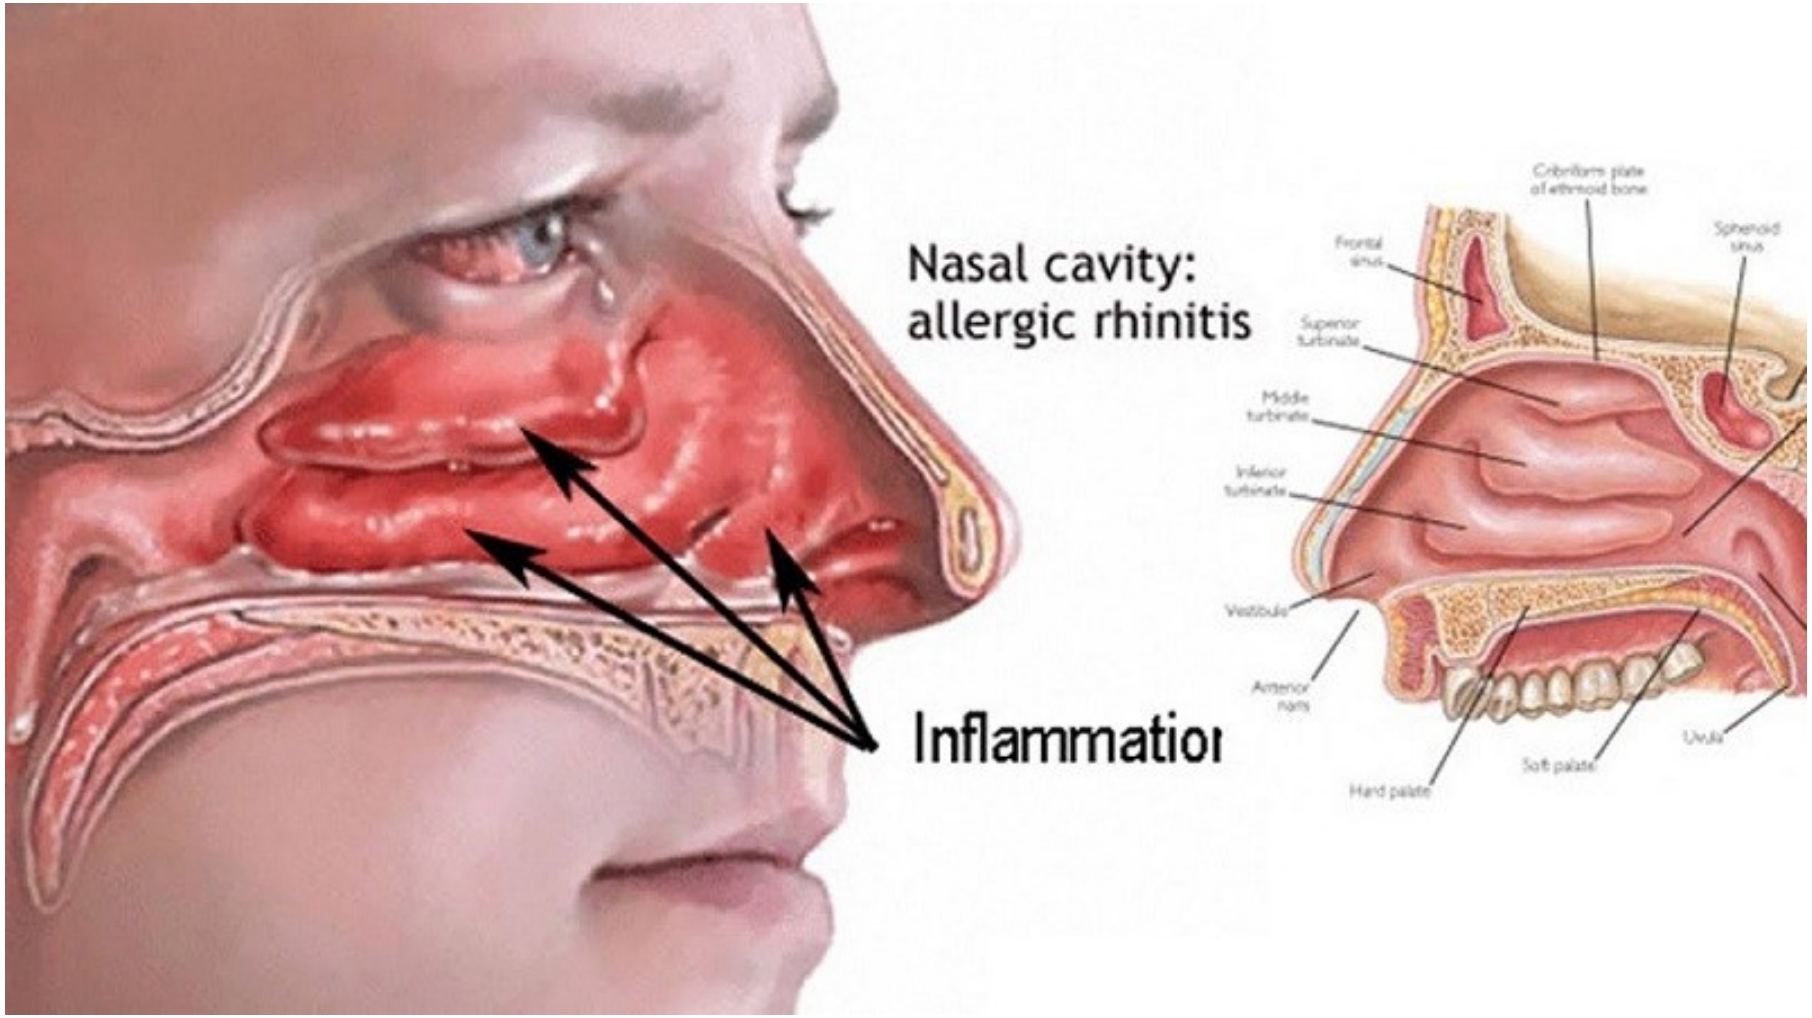

< Back

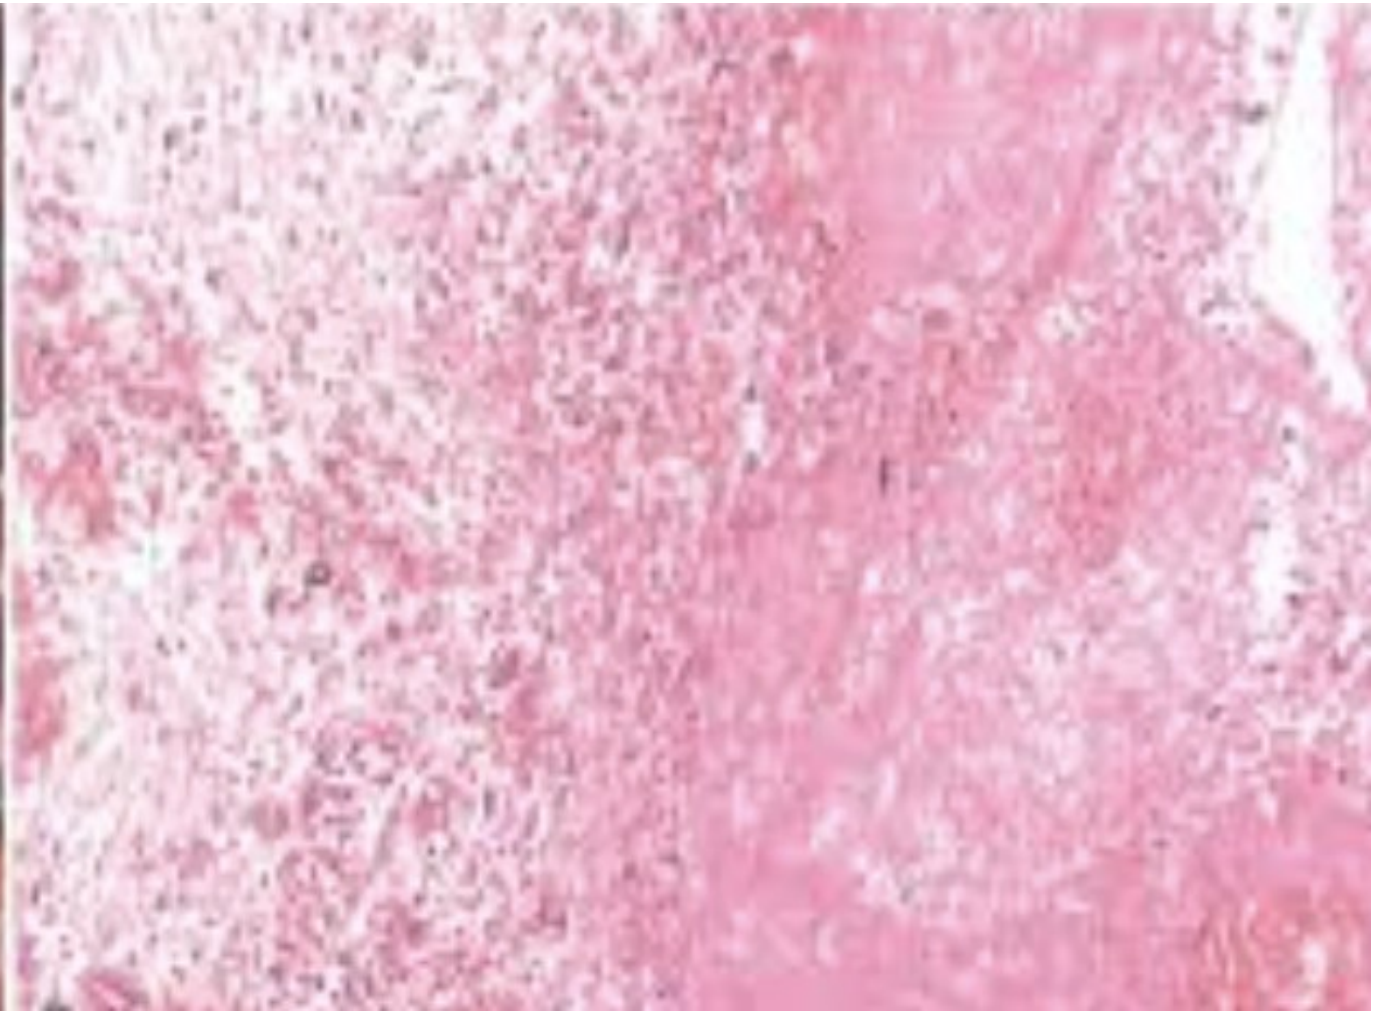

Serous inflammation: Microscopic medium power displays the disruption of epidermis at the basal level leaving a clear-fluid-filled bullous lesion.

What is the diagnosis?

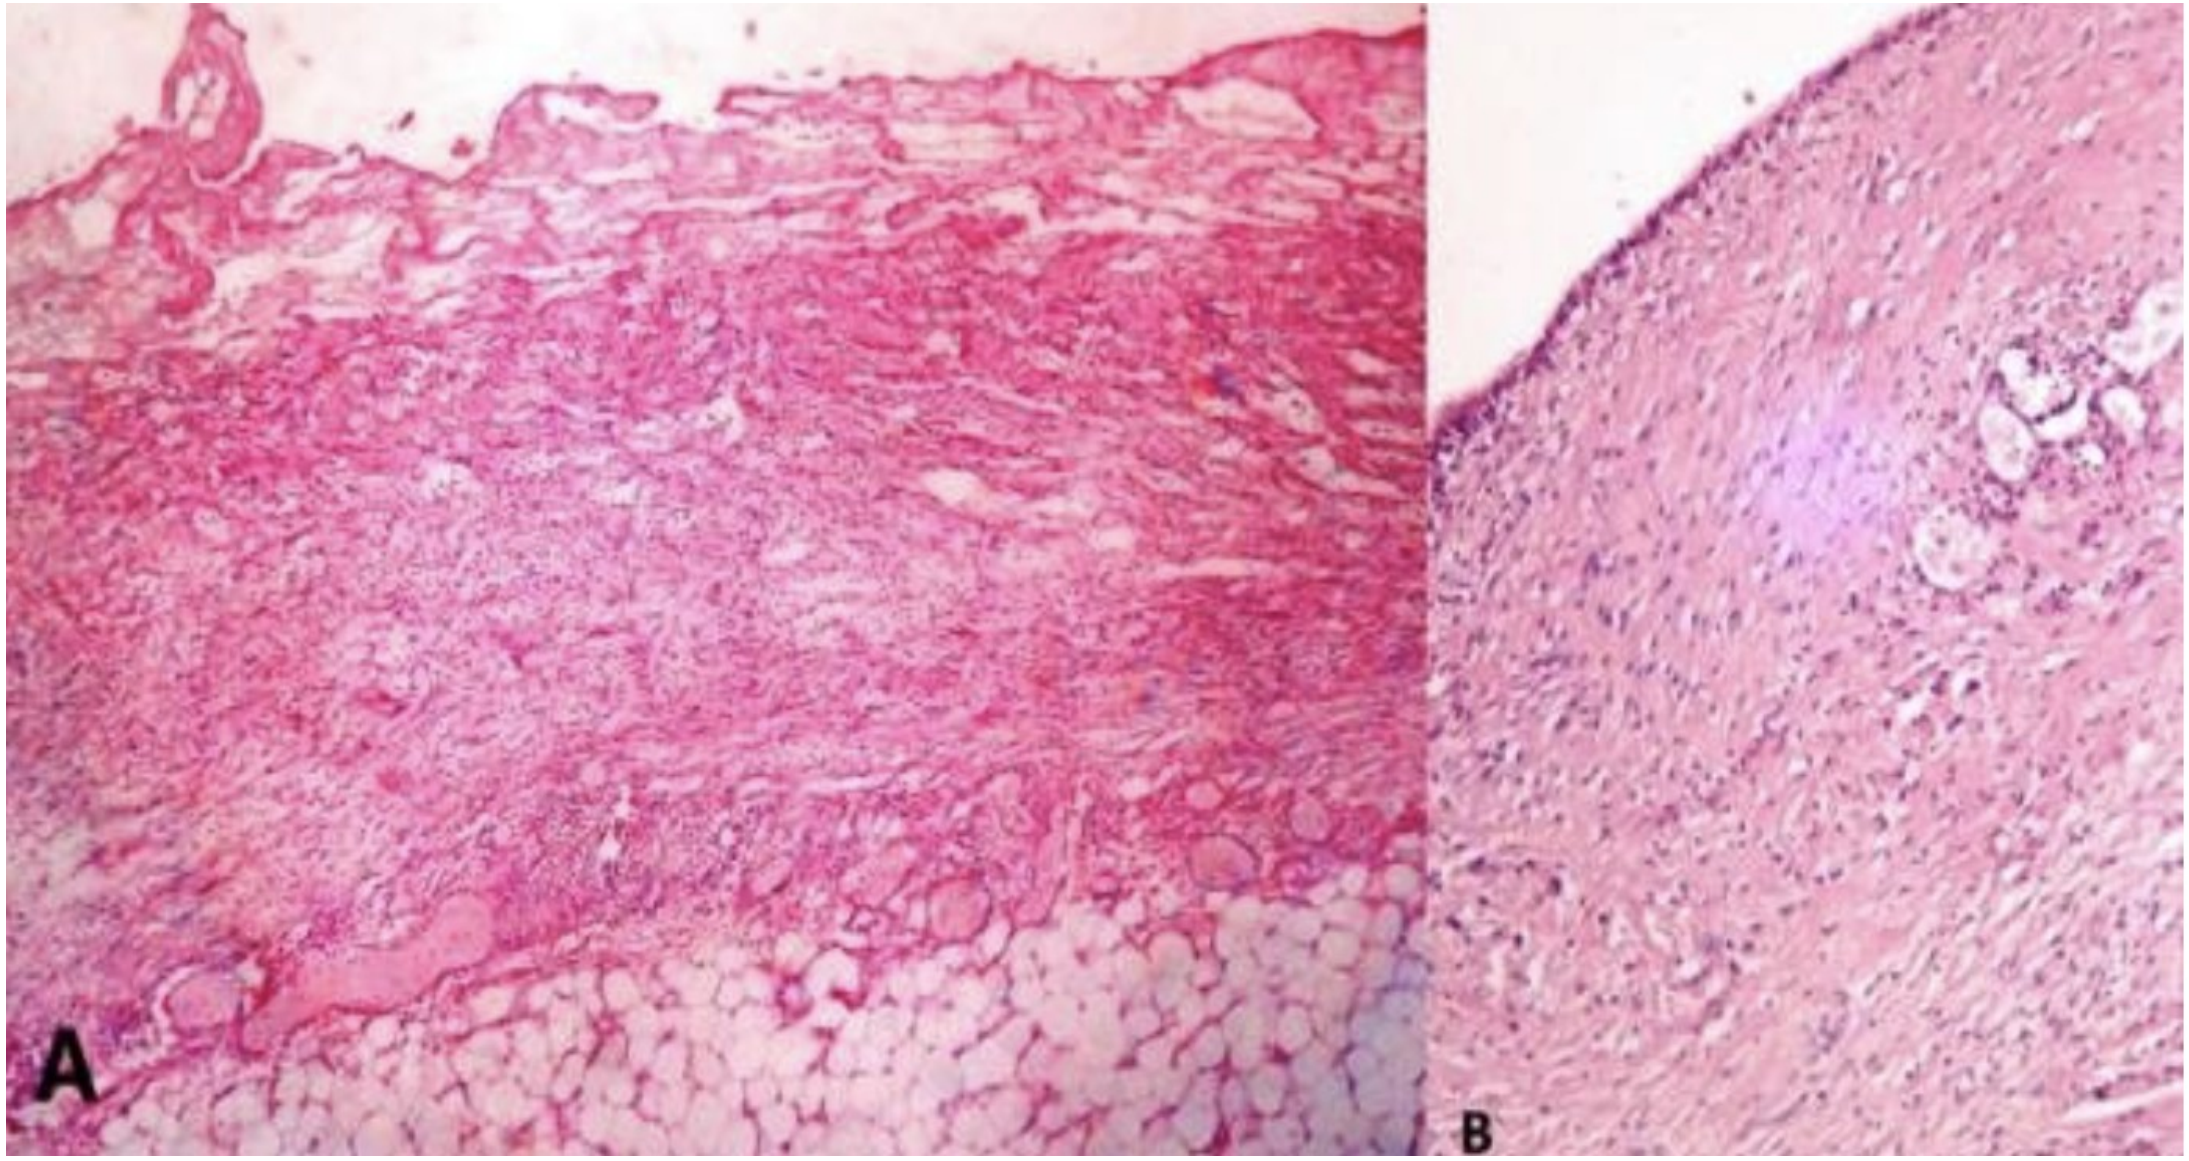

Fibrinous inflammation

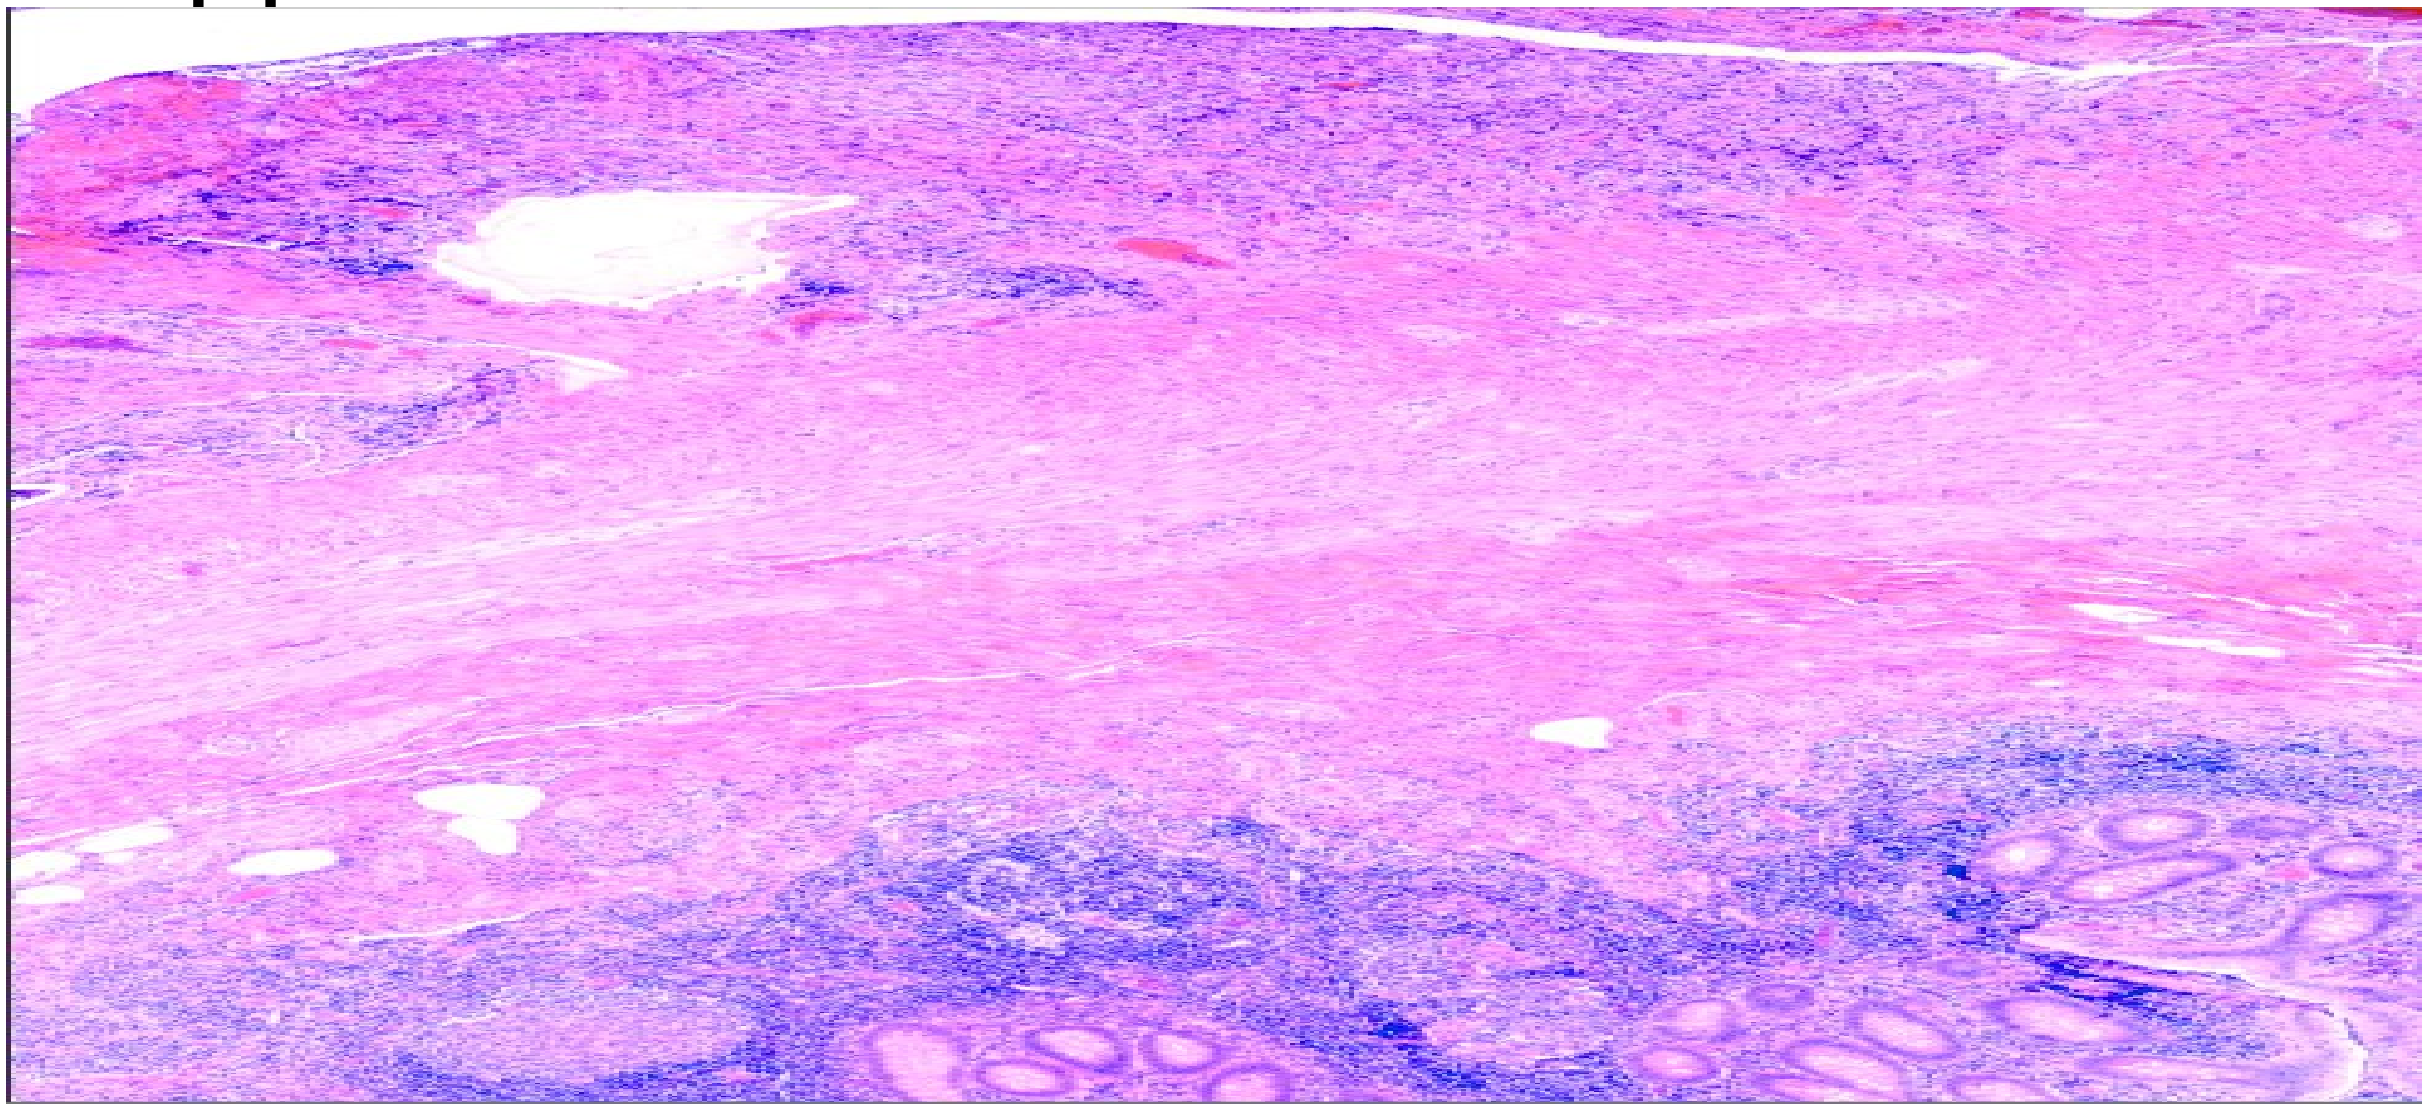

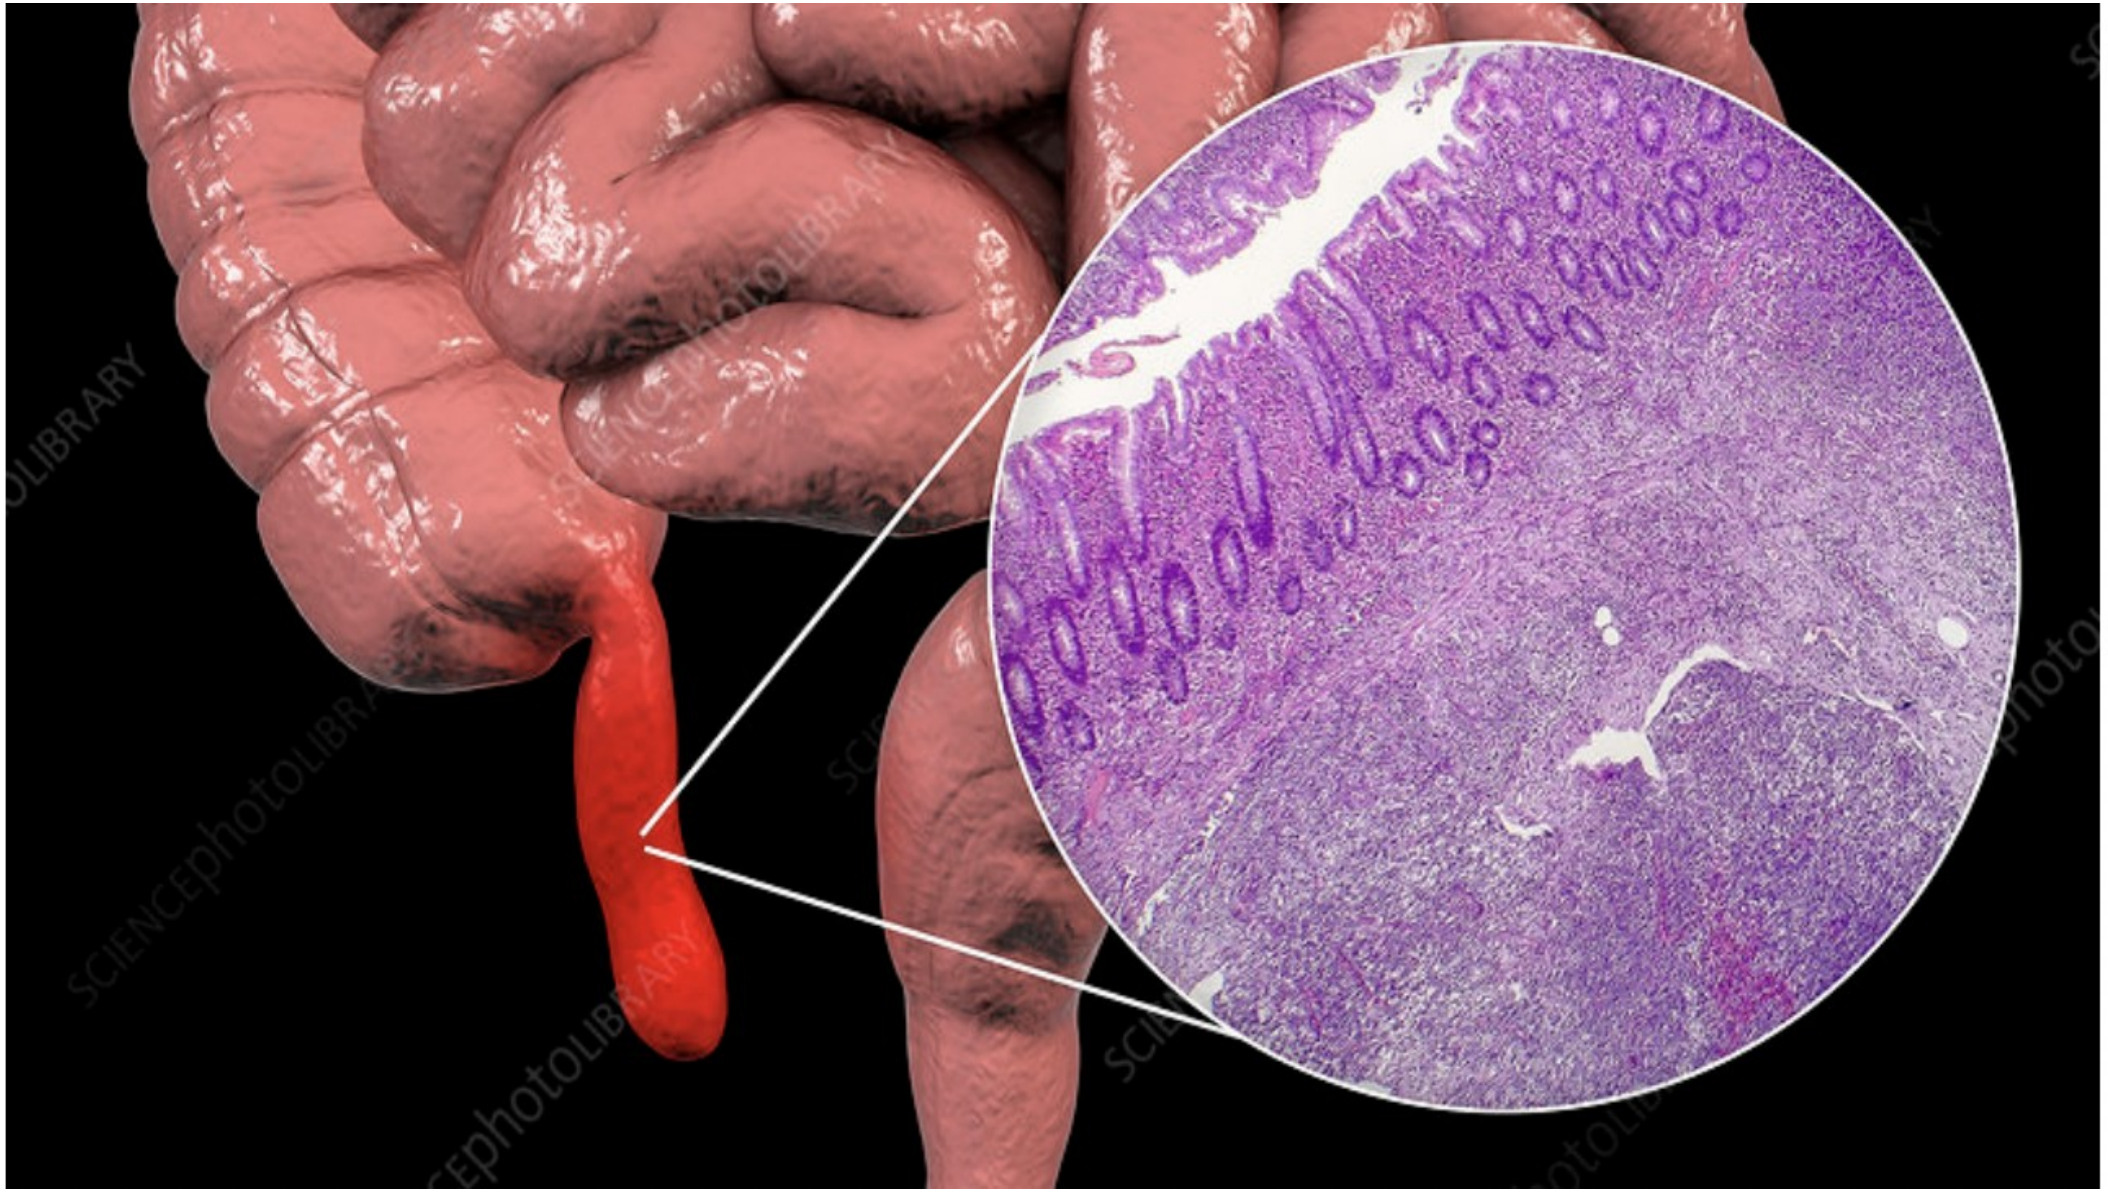

Pericardium showing extensive fibrinous exudate with inflammatory cell infiltrates suggesting fibrinous pericarditis

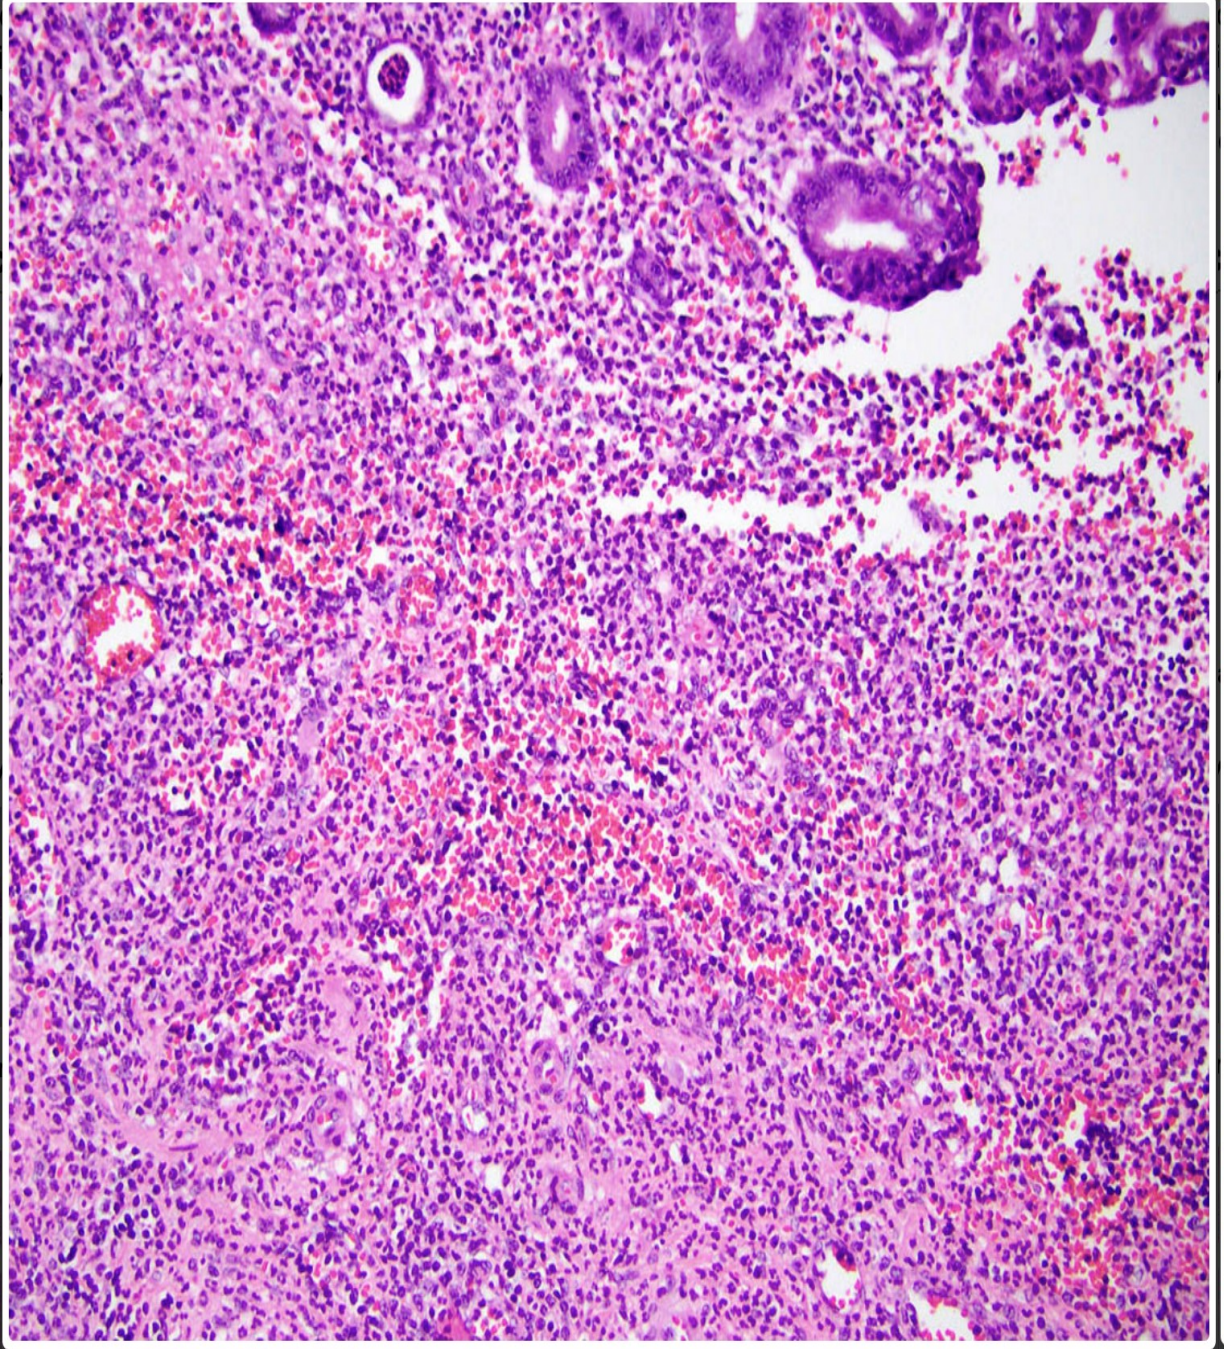

Fibrinous inflammation Appendix

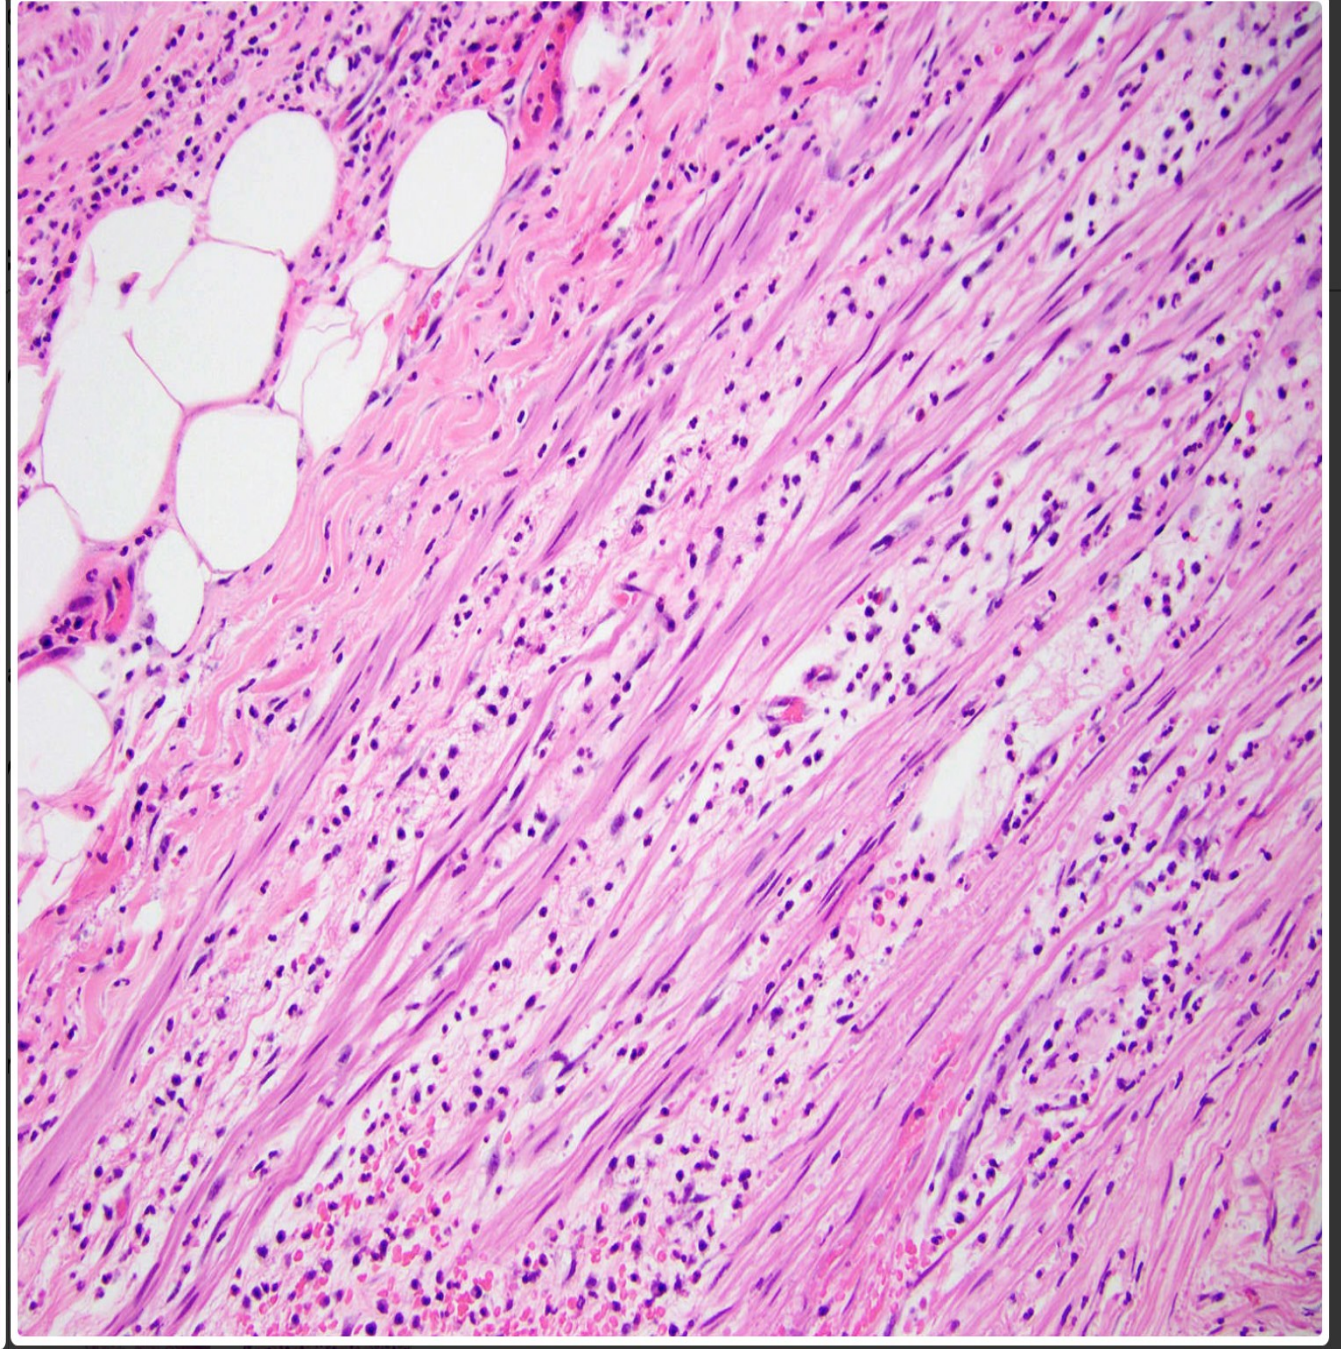

Suppurative inflammation

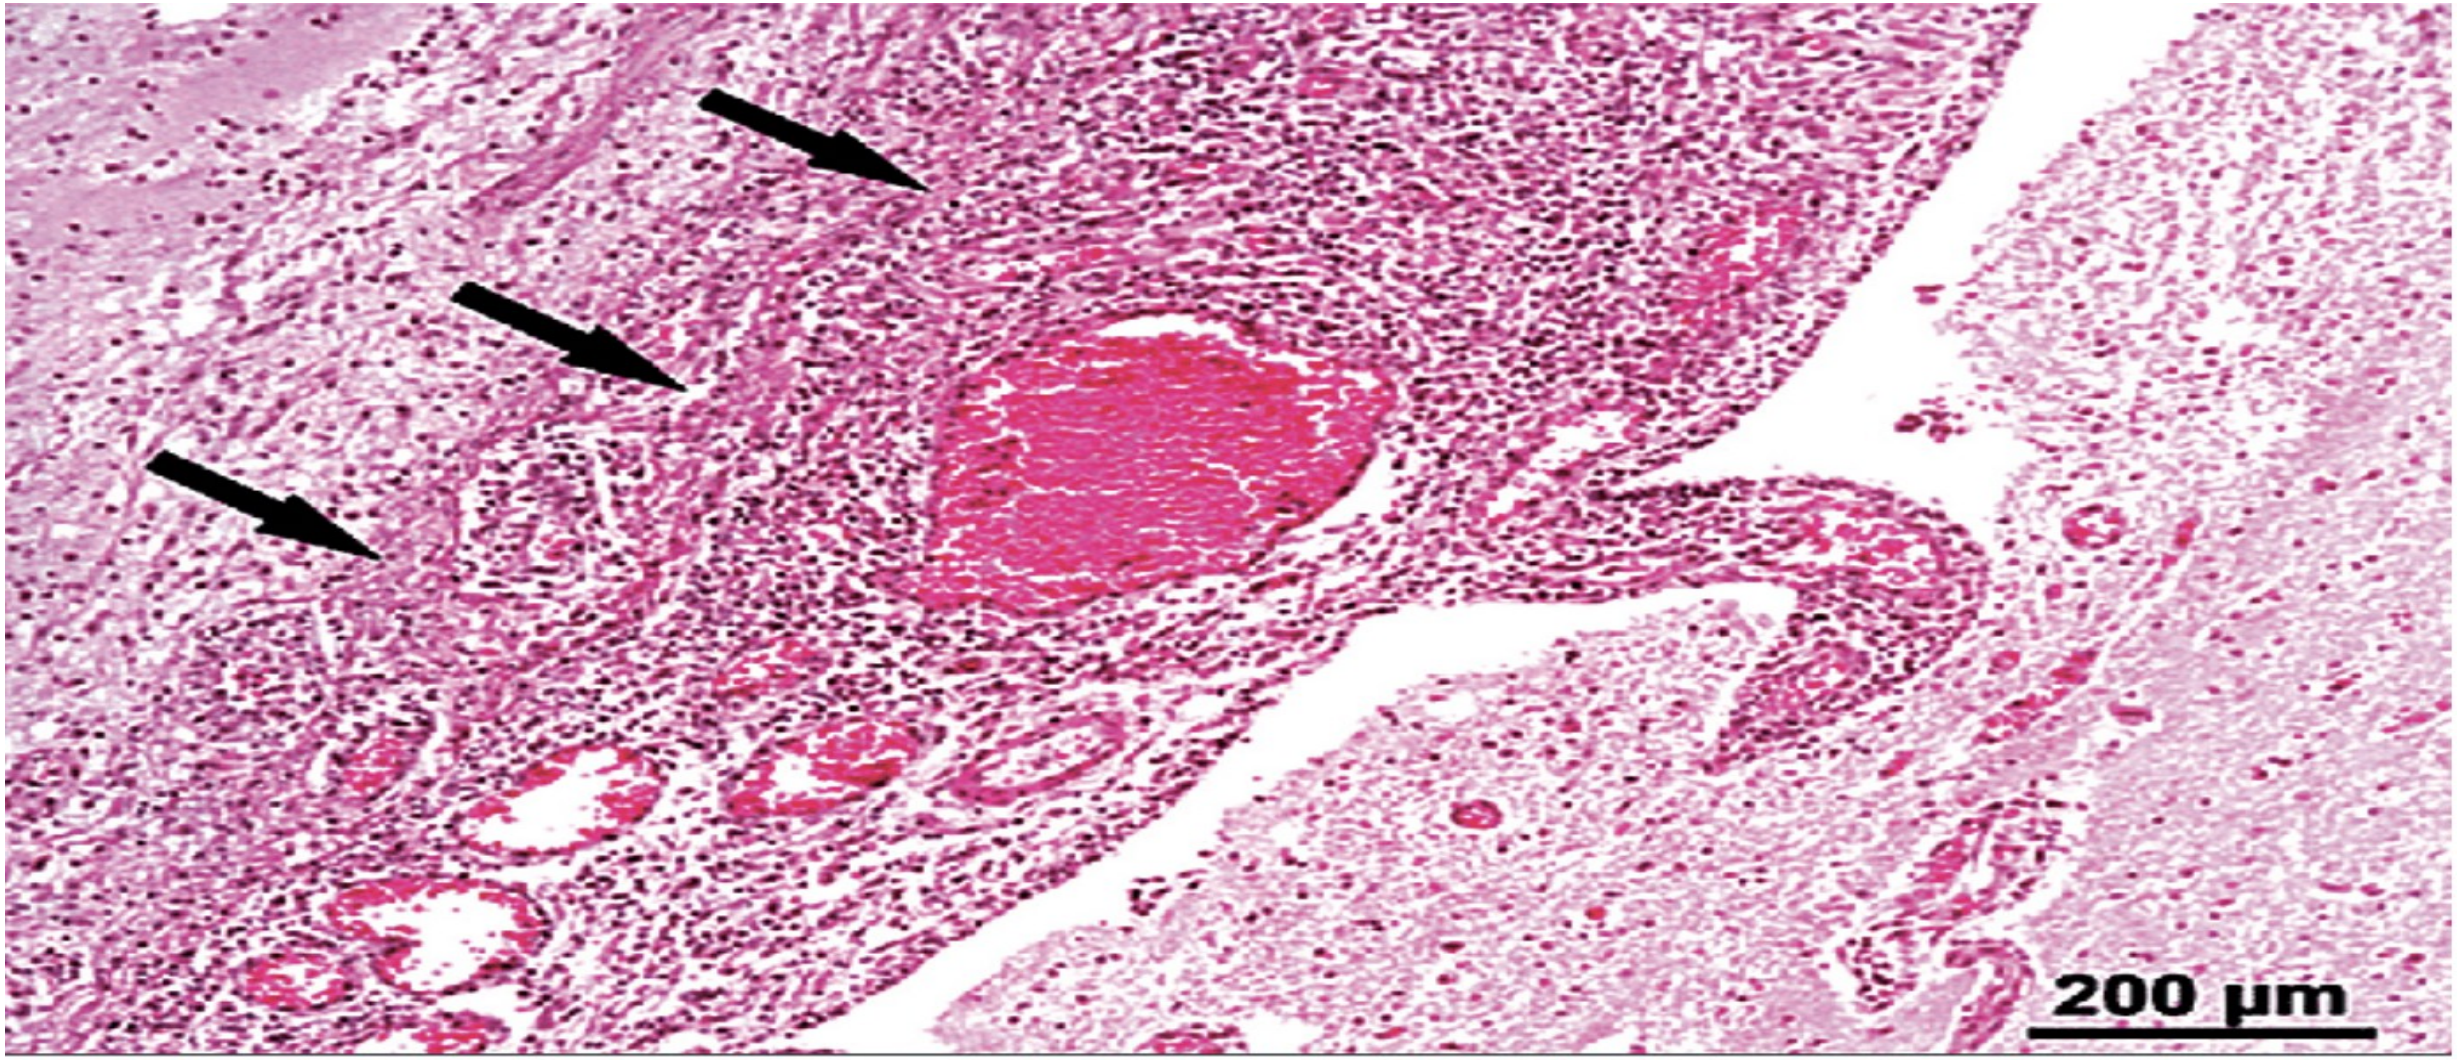

Marked neutrophilic infiltration of appendiceal wall.

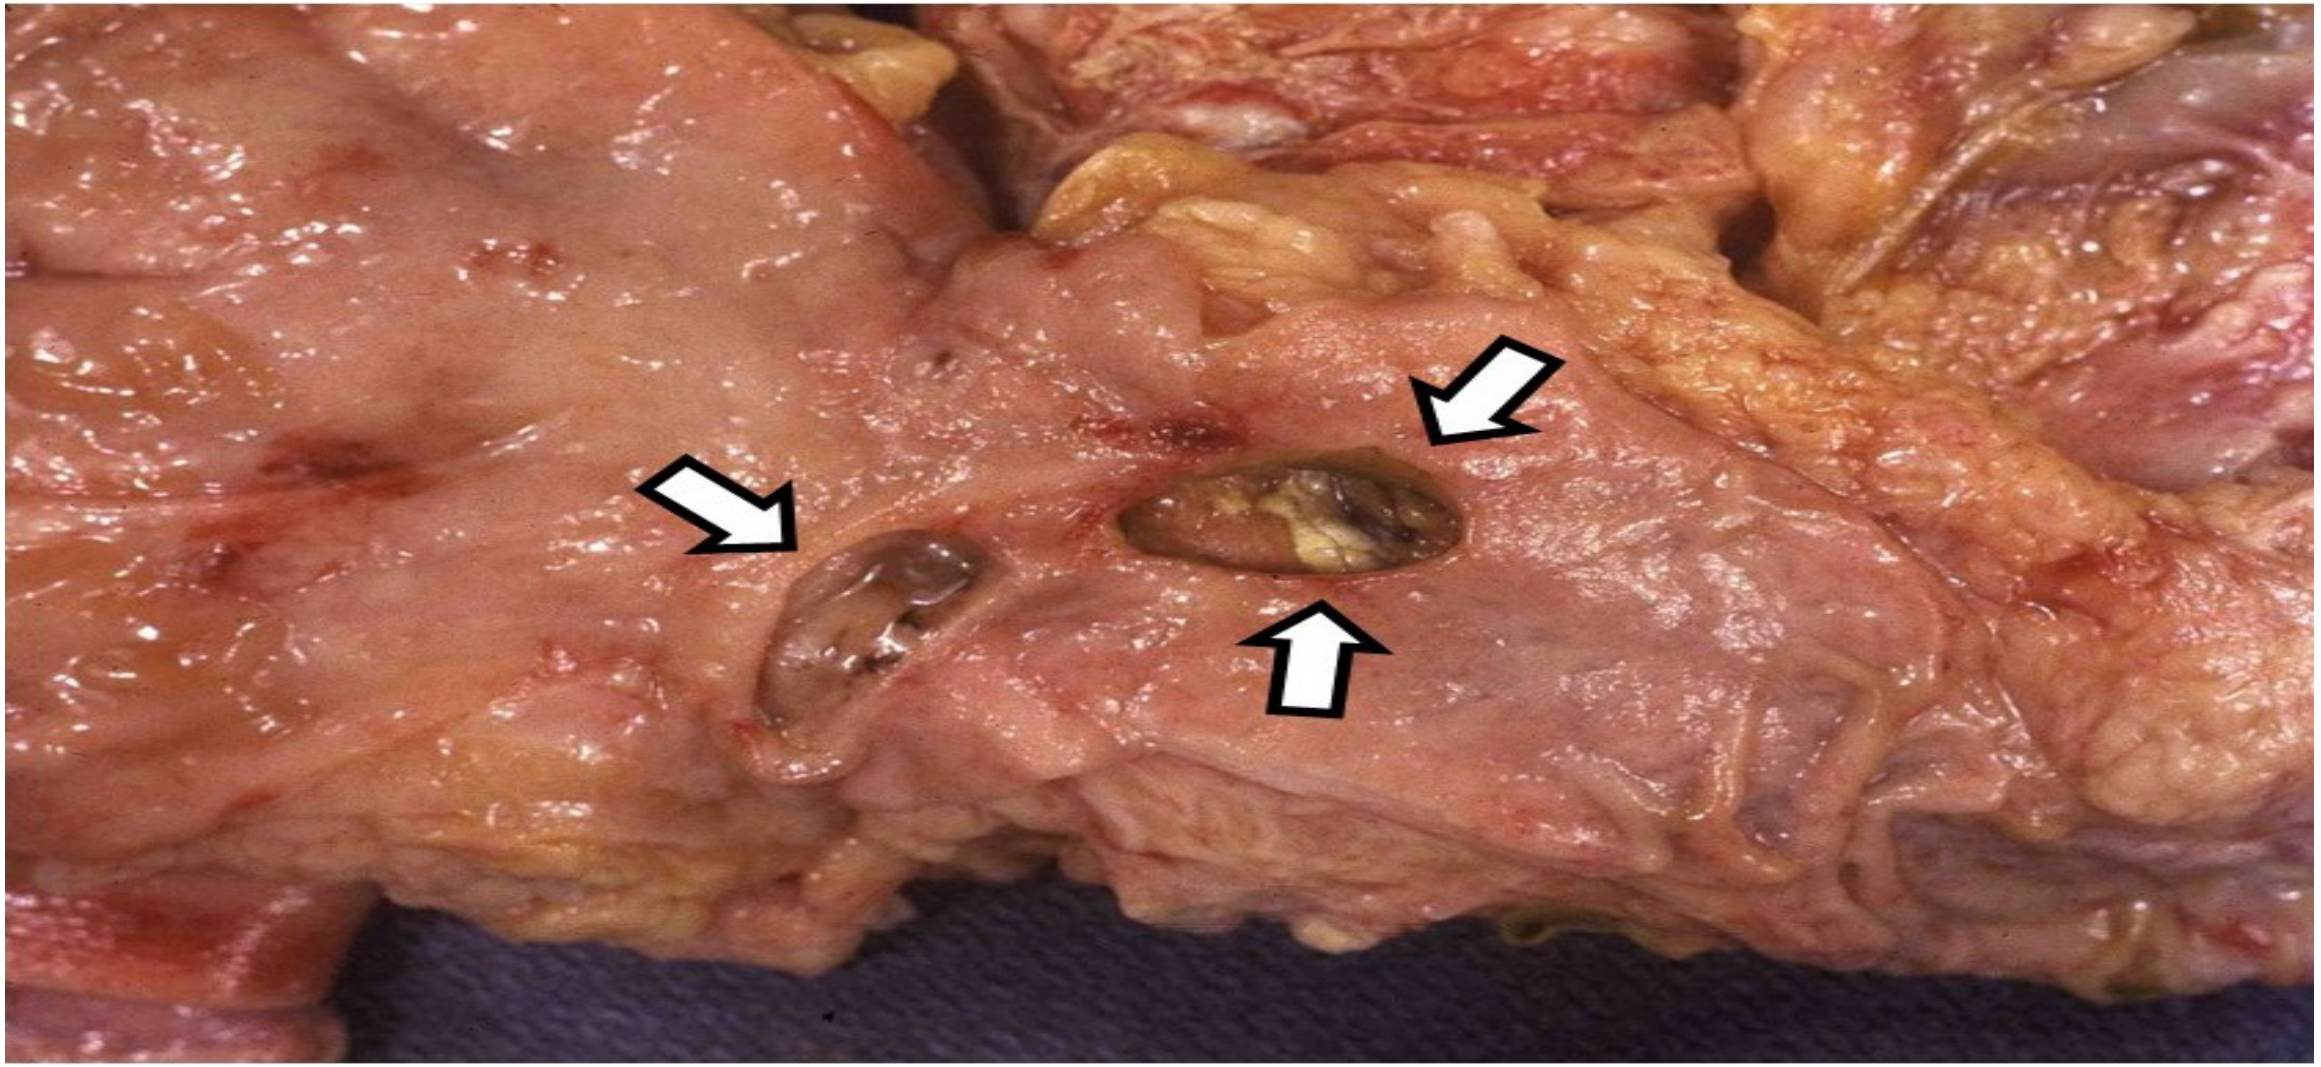

Marked neutrophilic infiltration of appendiceal wall.

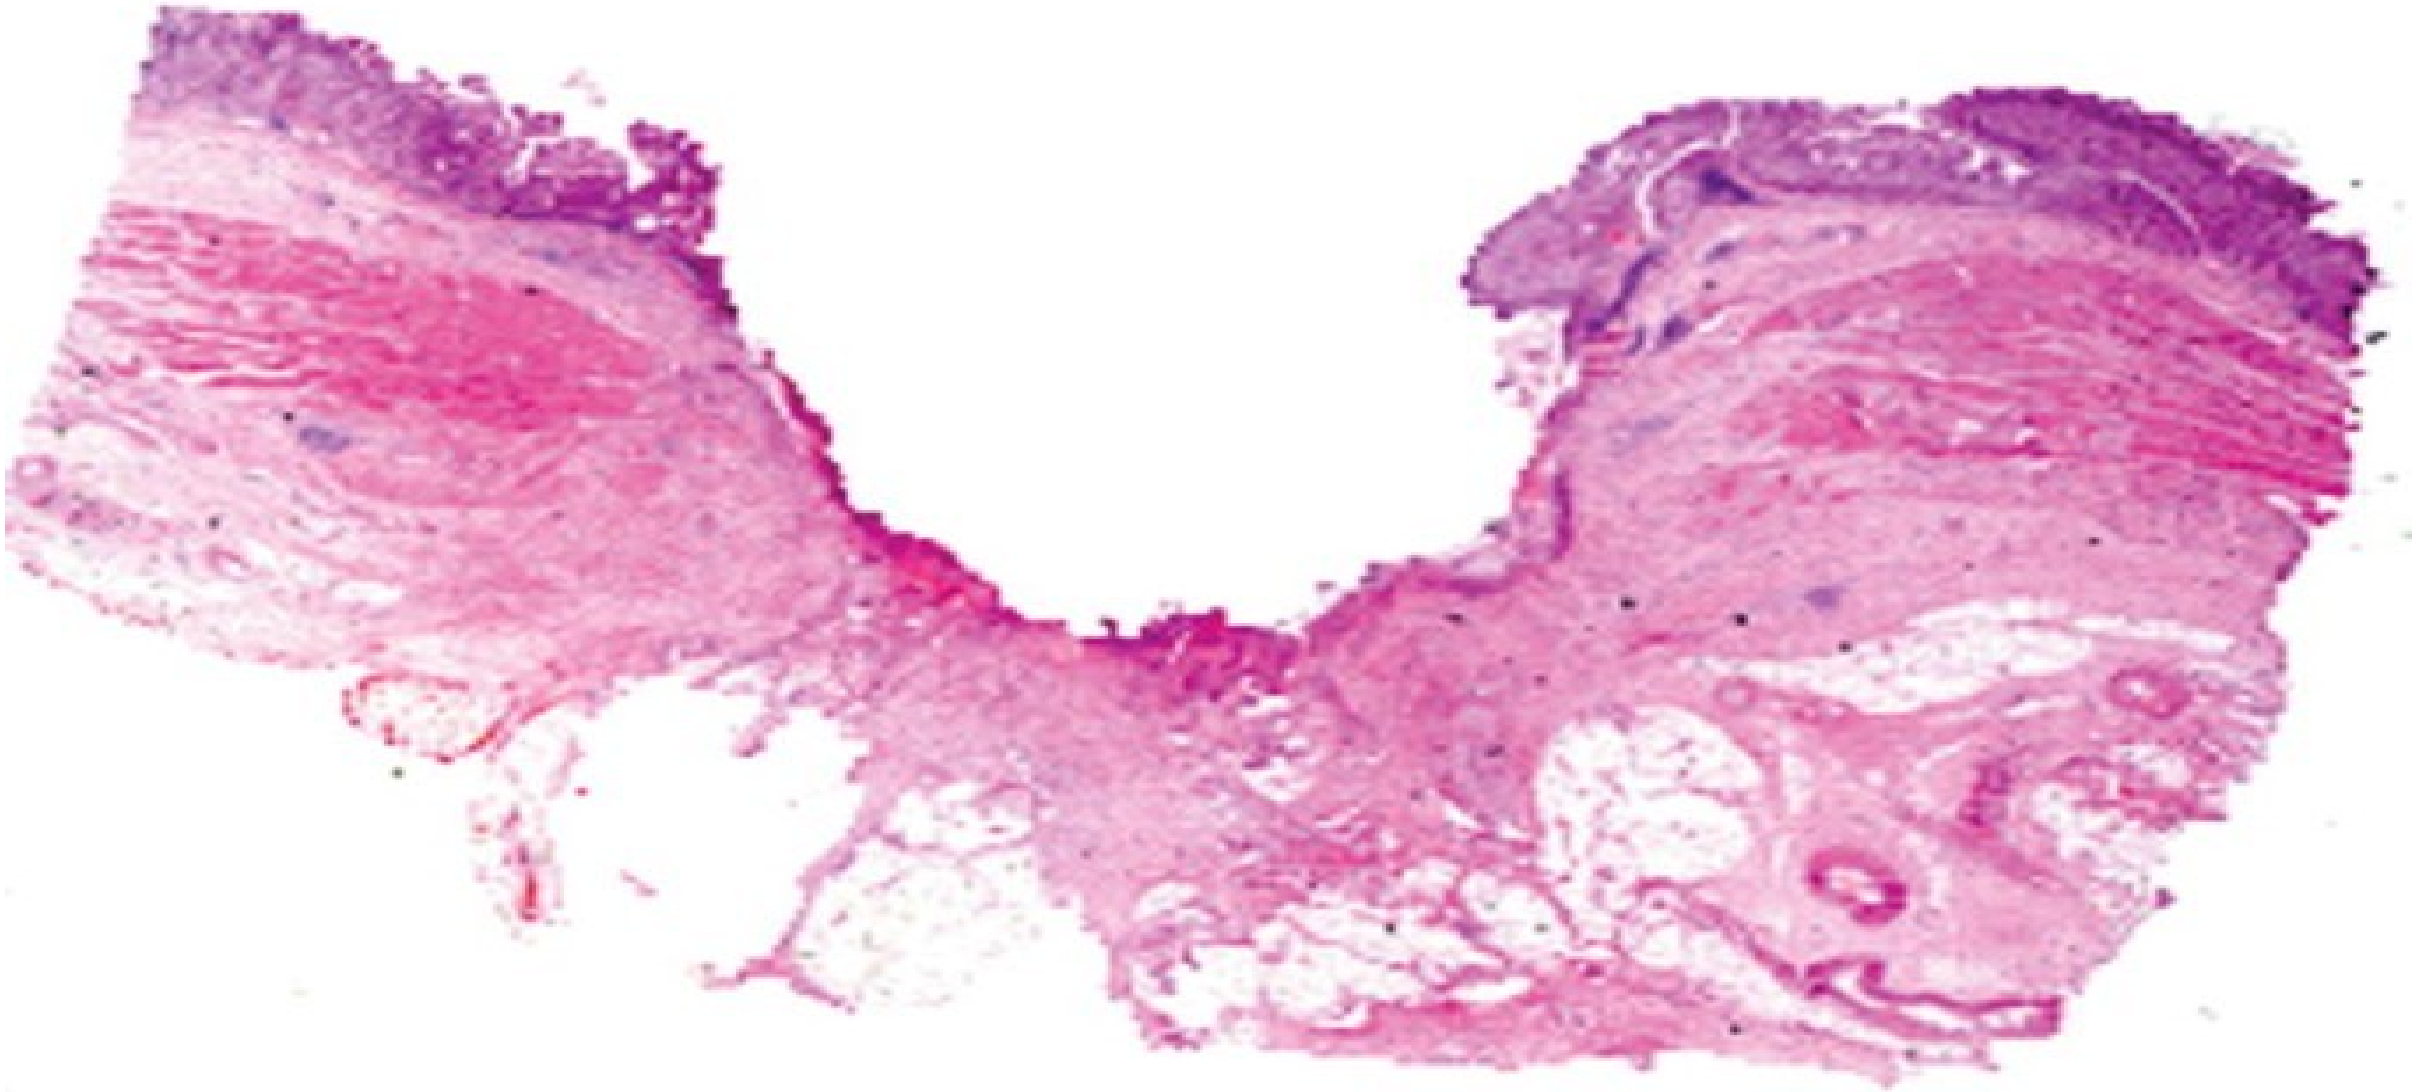

Brain abscess

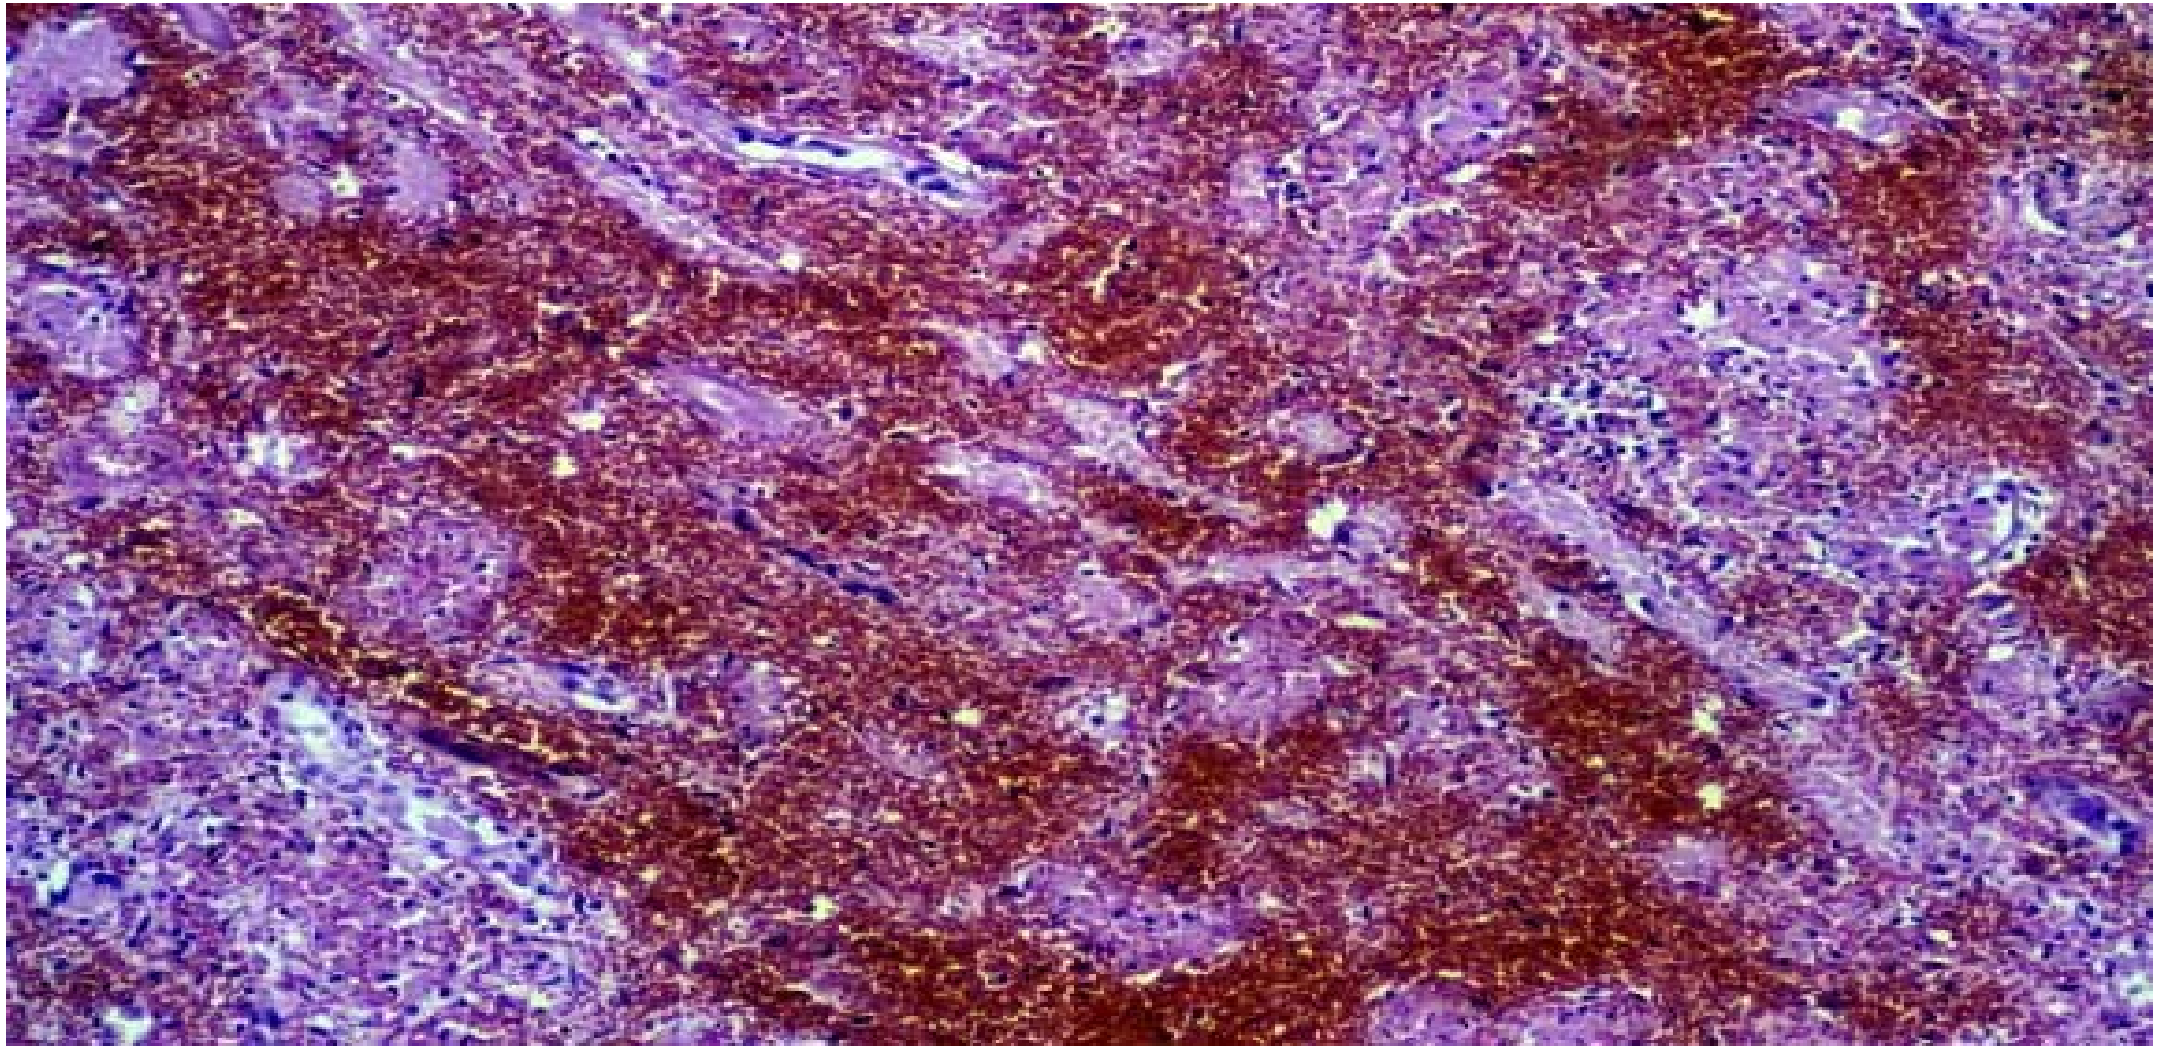

Gross/ peptic ulcer

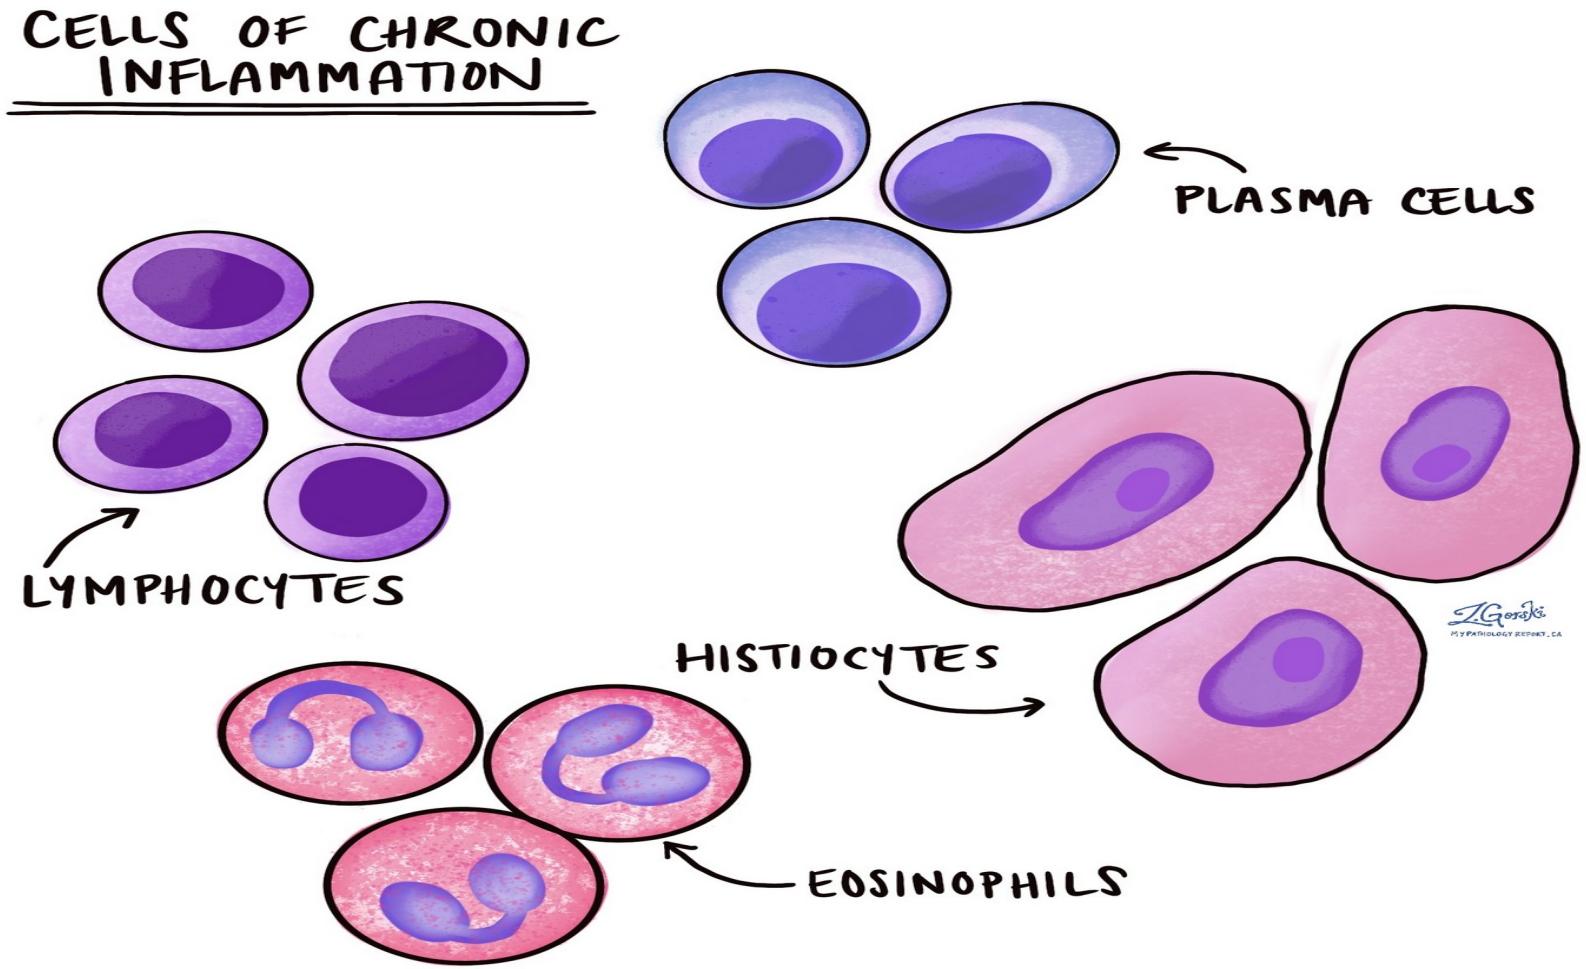

Peptic ulcer

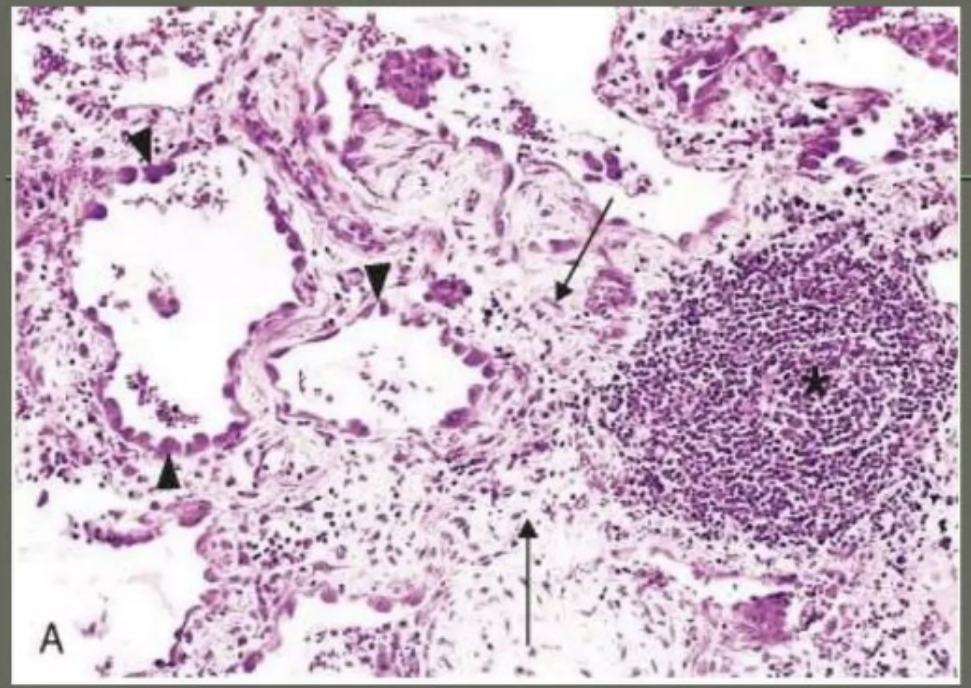

What is the diagnosis?

Chronic inflammatory cells

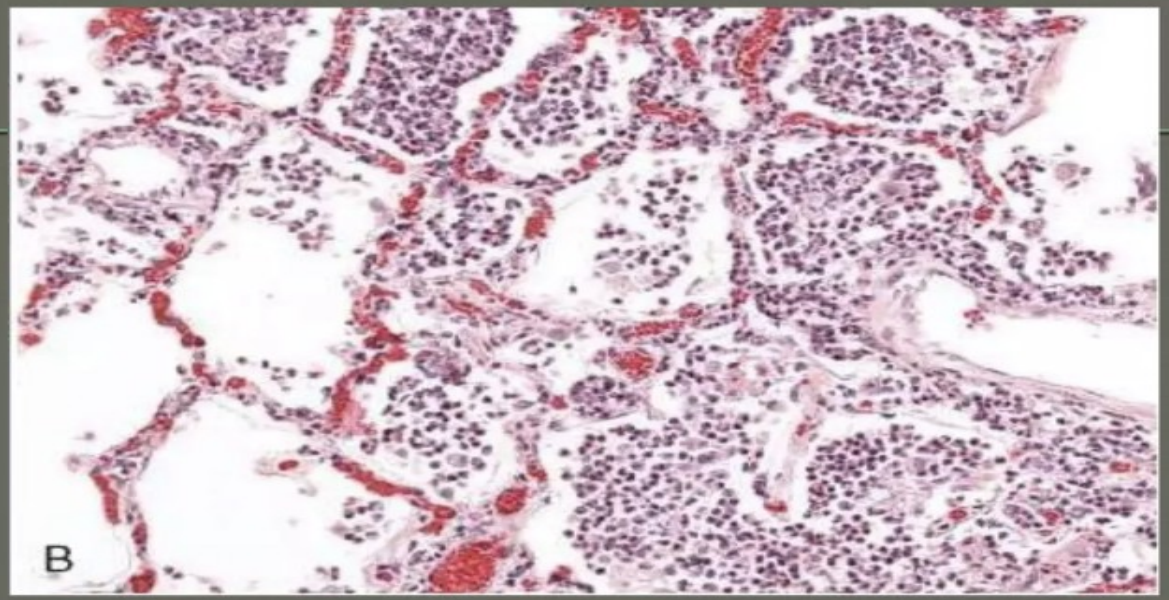

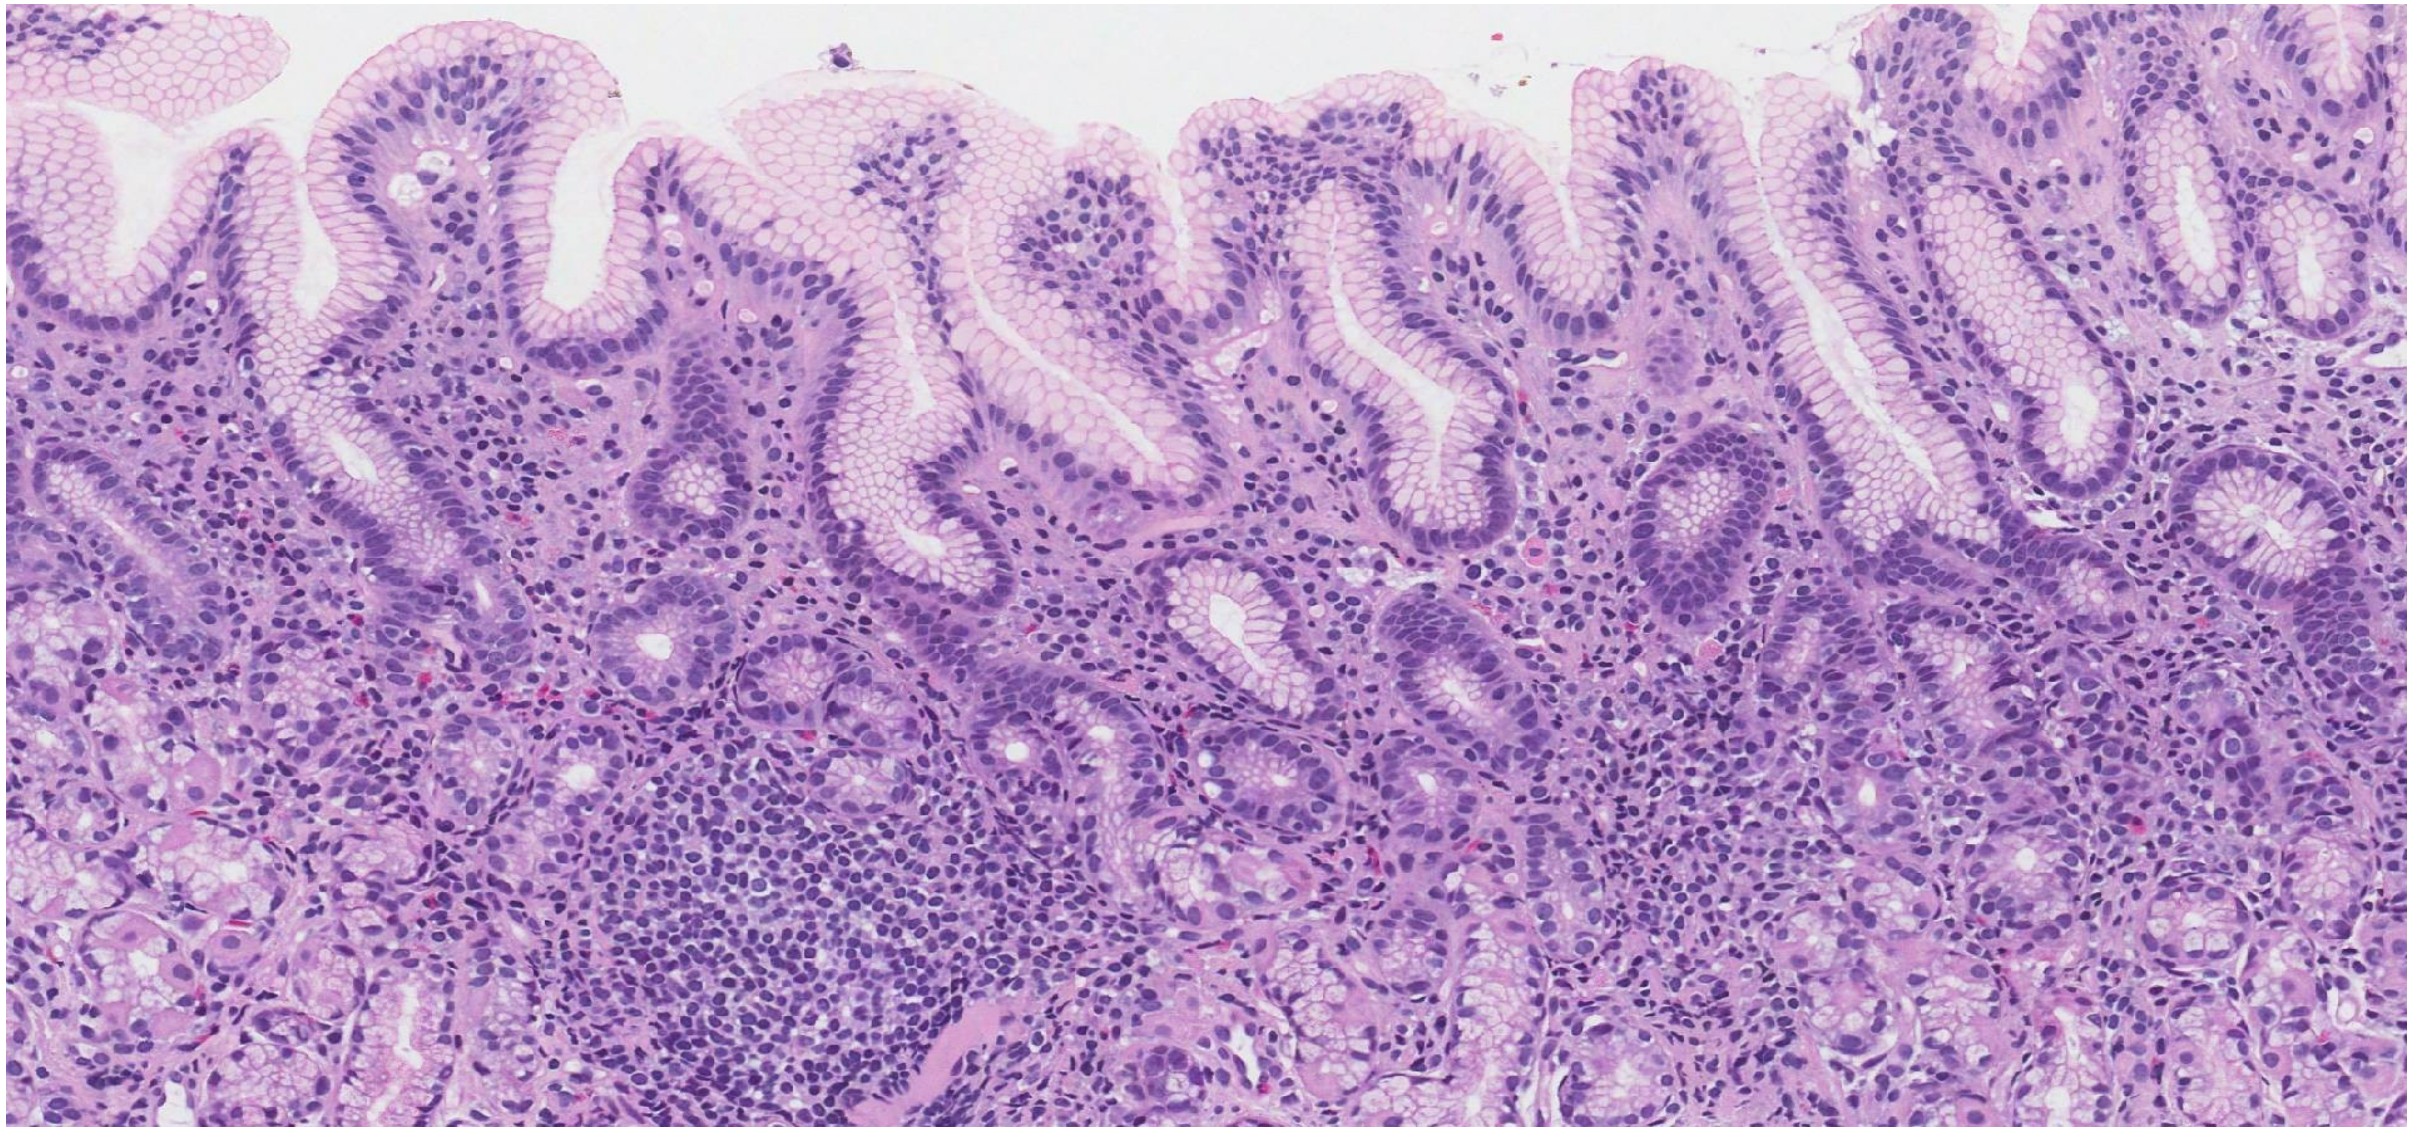

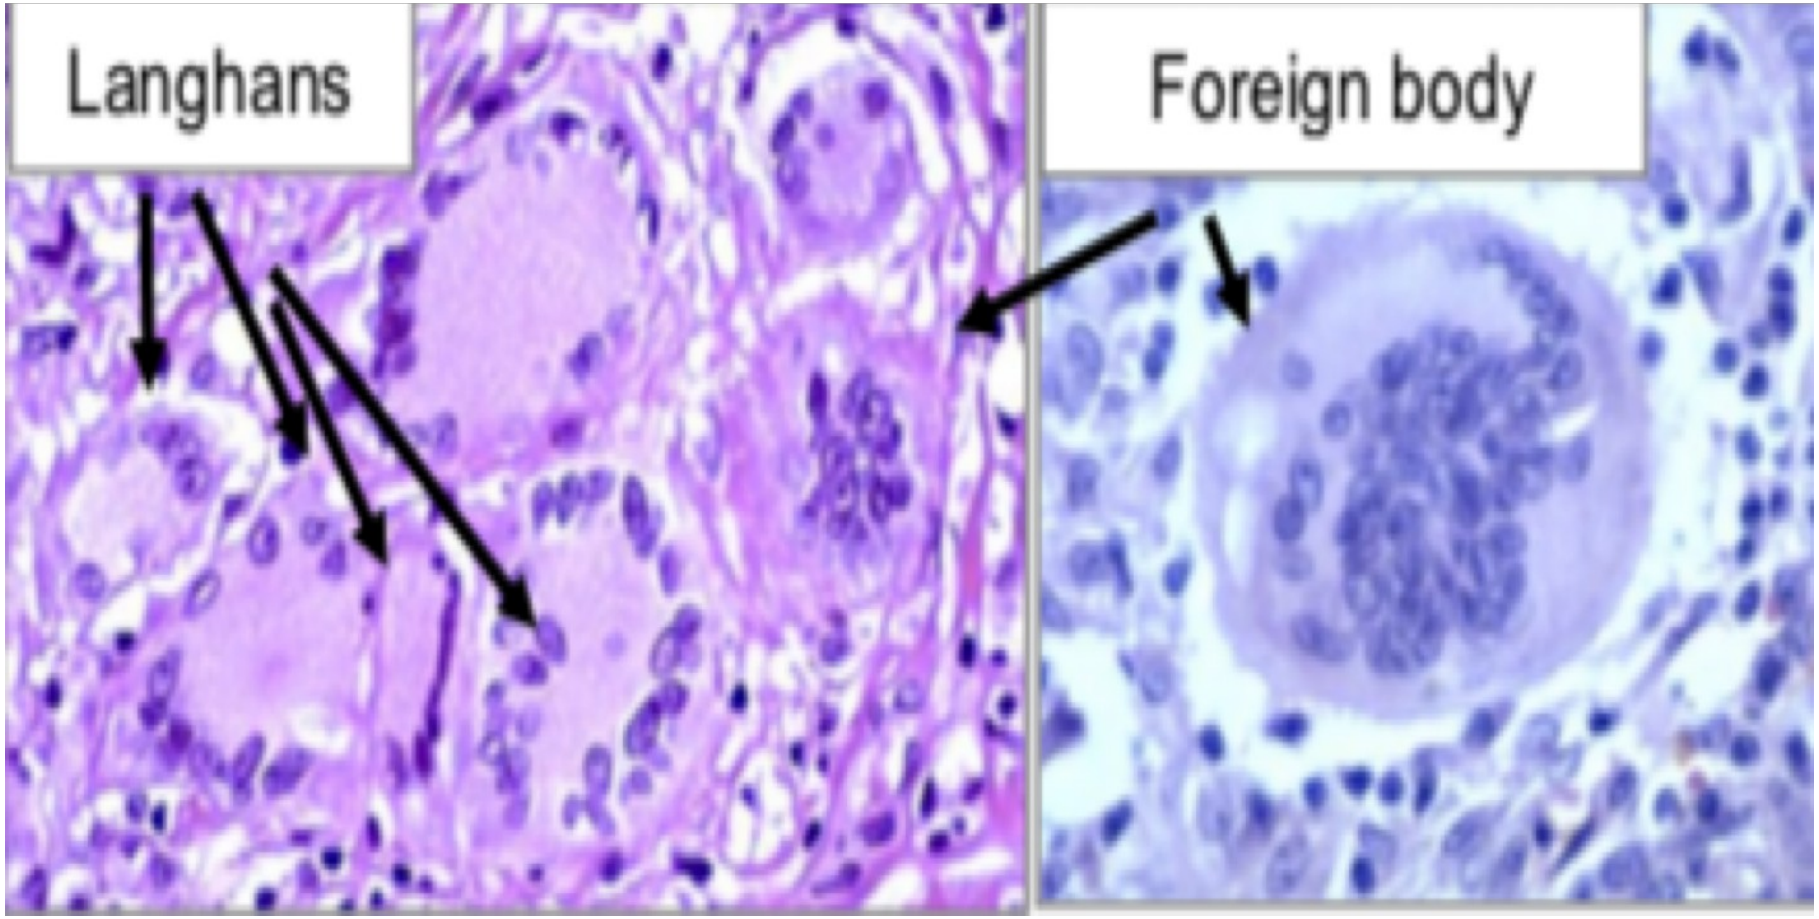

FIGURE 2-22 **A**, Chronic inflammation in the lung, showing all three characteristic histologic features: (1) collection of chronic inflammatory cells (*), (2) destruction of parenchyma (normal alveoli are replaced by spaces lined by cuboidal epithelium, *arrowheads*), and (3) replacement by connective tissue (fibrosis, *arrows*). **B**, By contrast, in acute inflammation of the lung (acute bronchopneumonia), neutrophils fill the alveolar spaces and blood vessels are congested.

M/F Chronic inflammation

Giant cell

Granuloma

TUBERCULOUS LYMPHADENITIS: **Necrotizing granuloma**

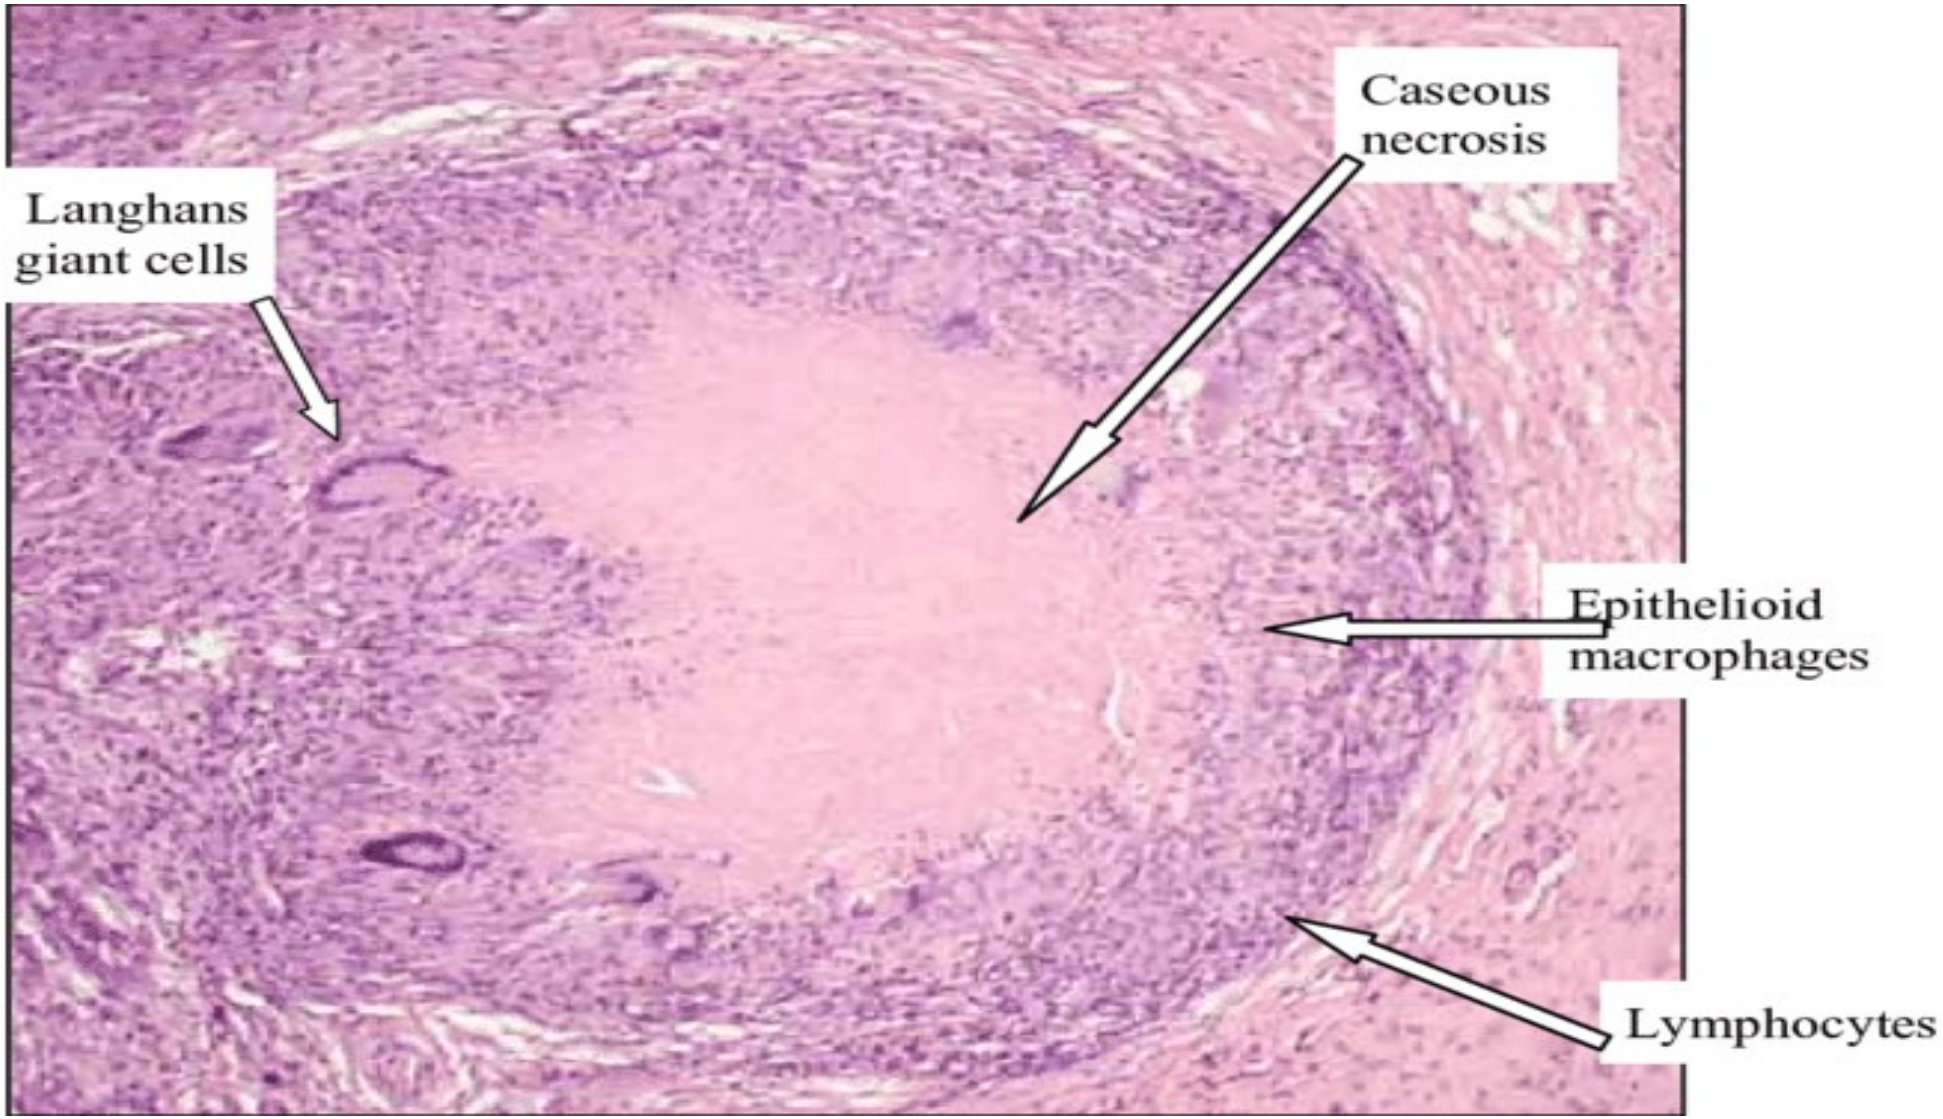

Amorphous granular eosinophilic debritic material
CASEOUS NECROSIS

Modified macrophages with abundant cytoplasm and pale staining "slipper" shaped nuclei
EPITHELOID CELLS

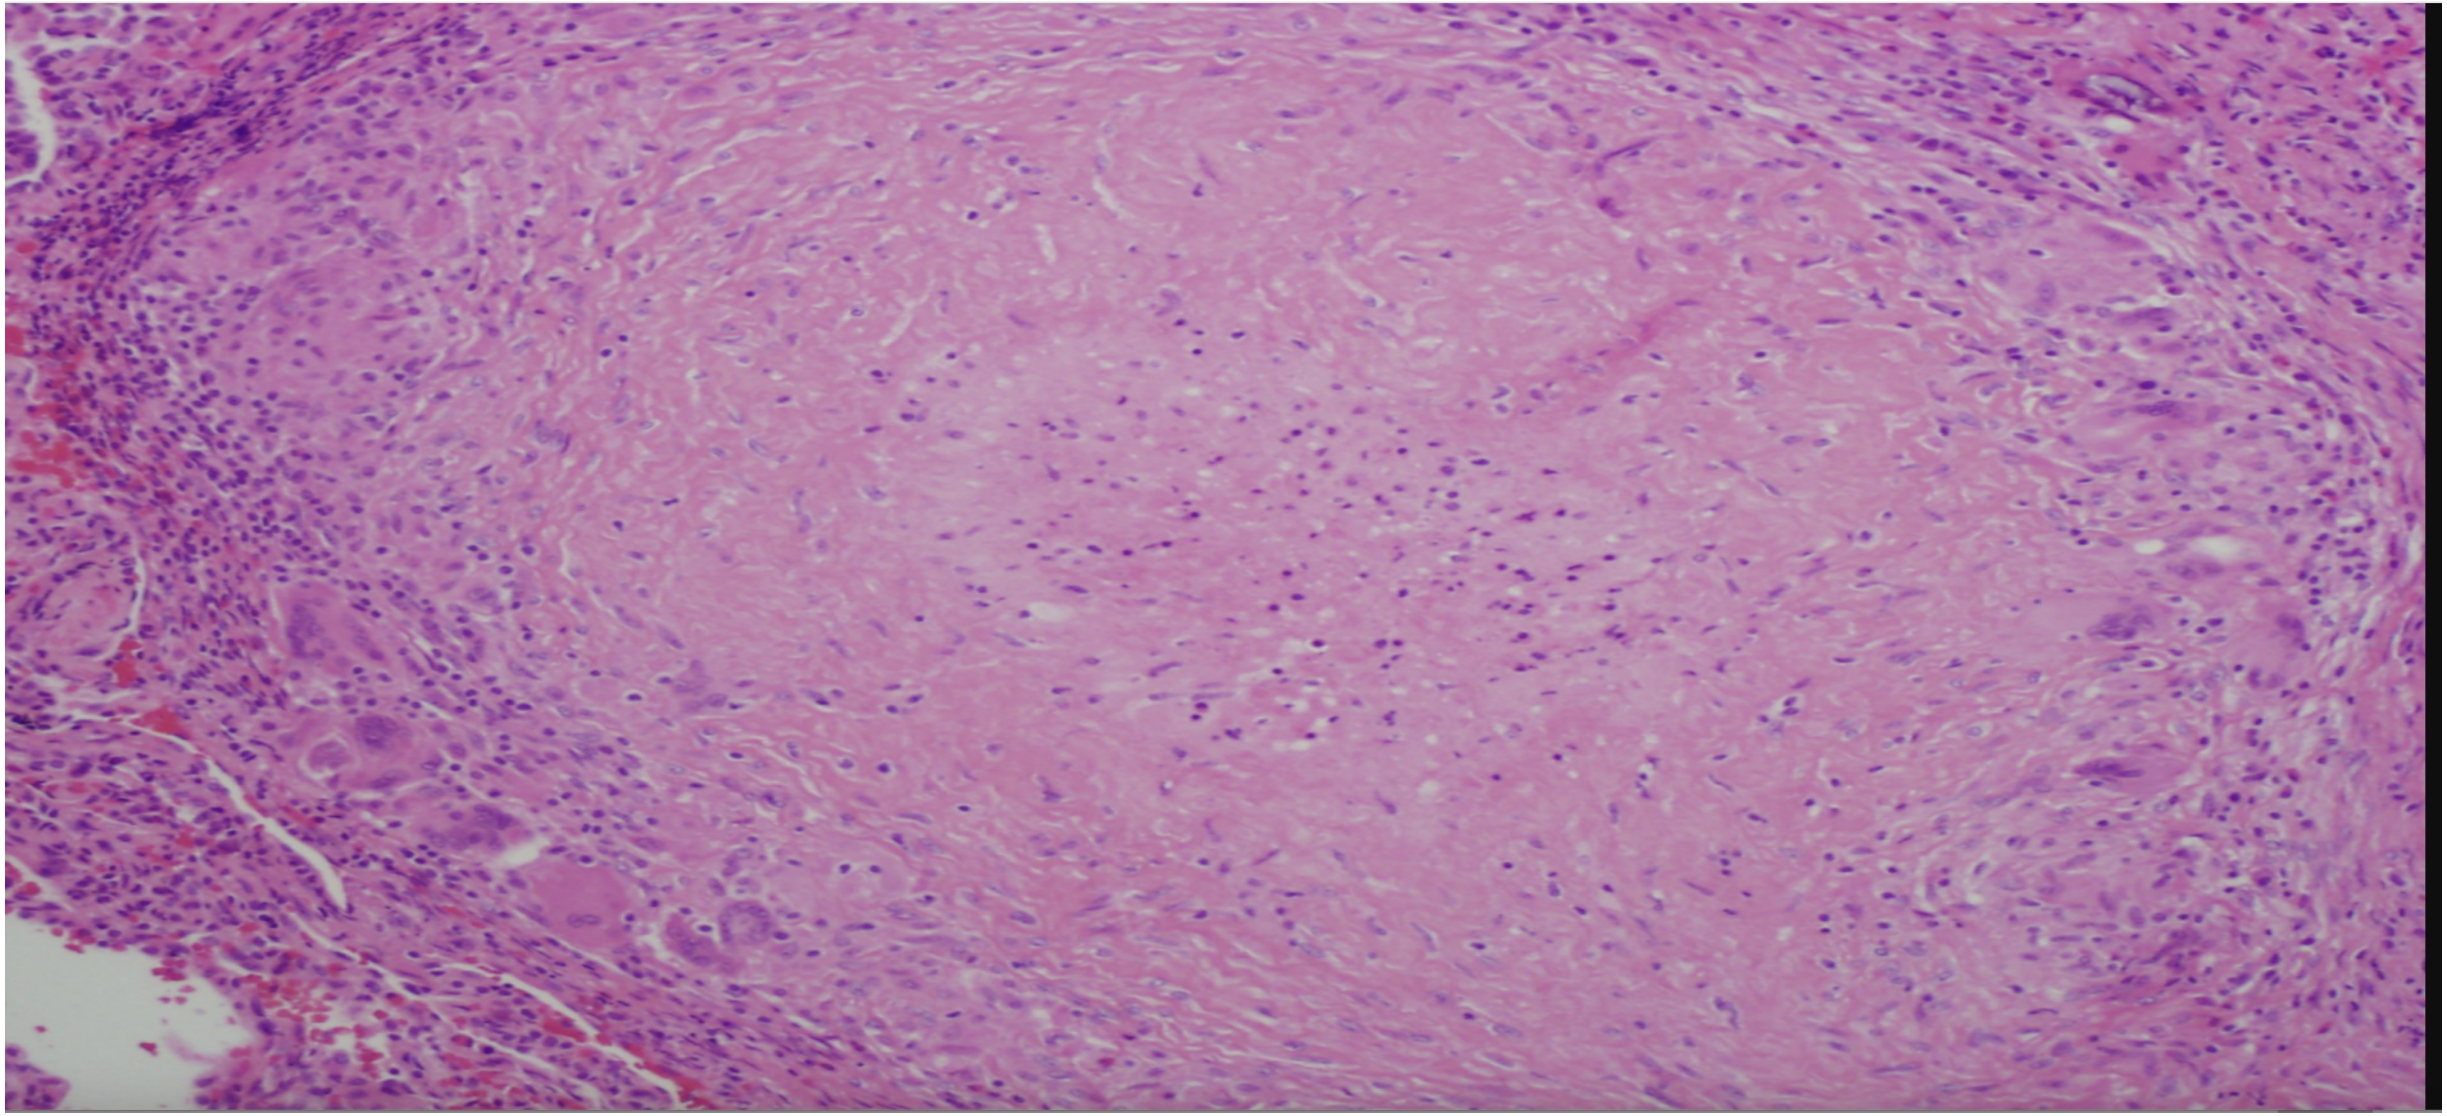

Multinucleated giant cell
LANGHAN GIANT CELL

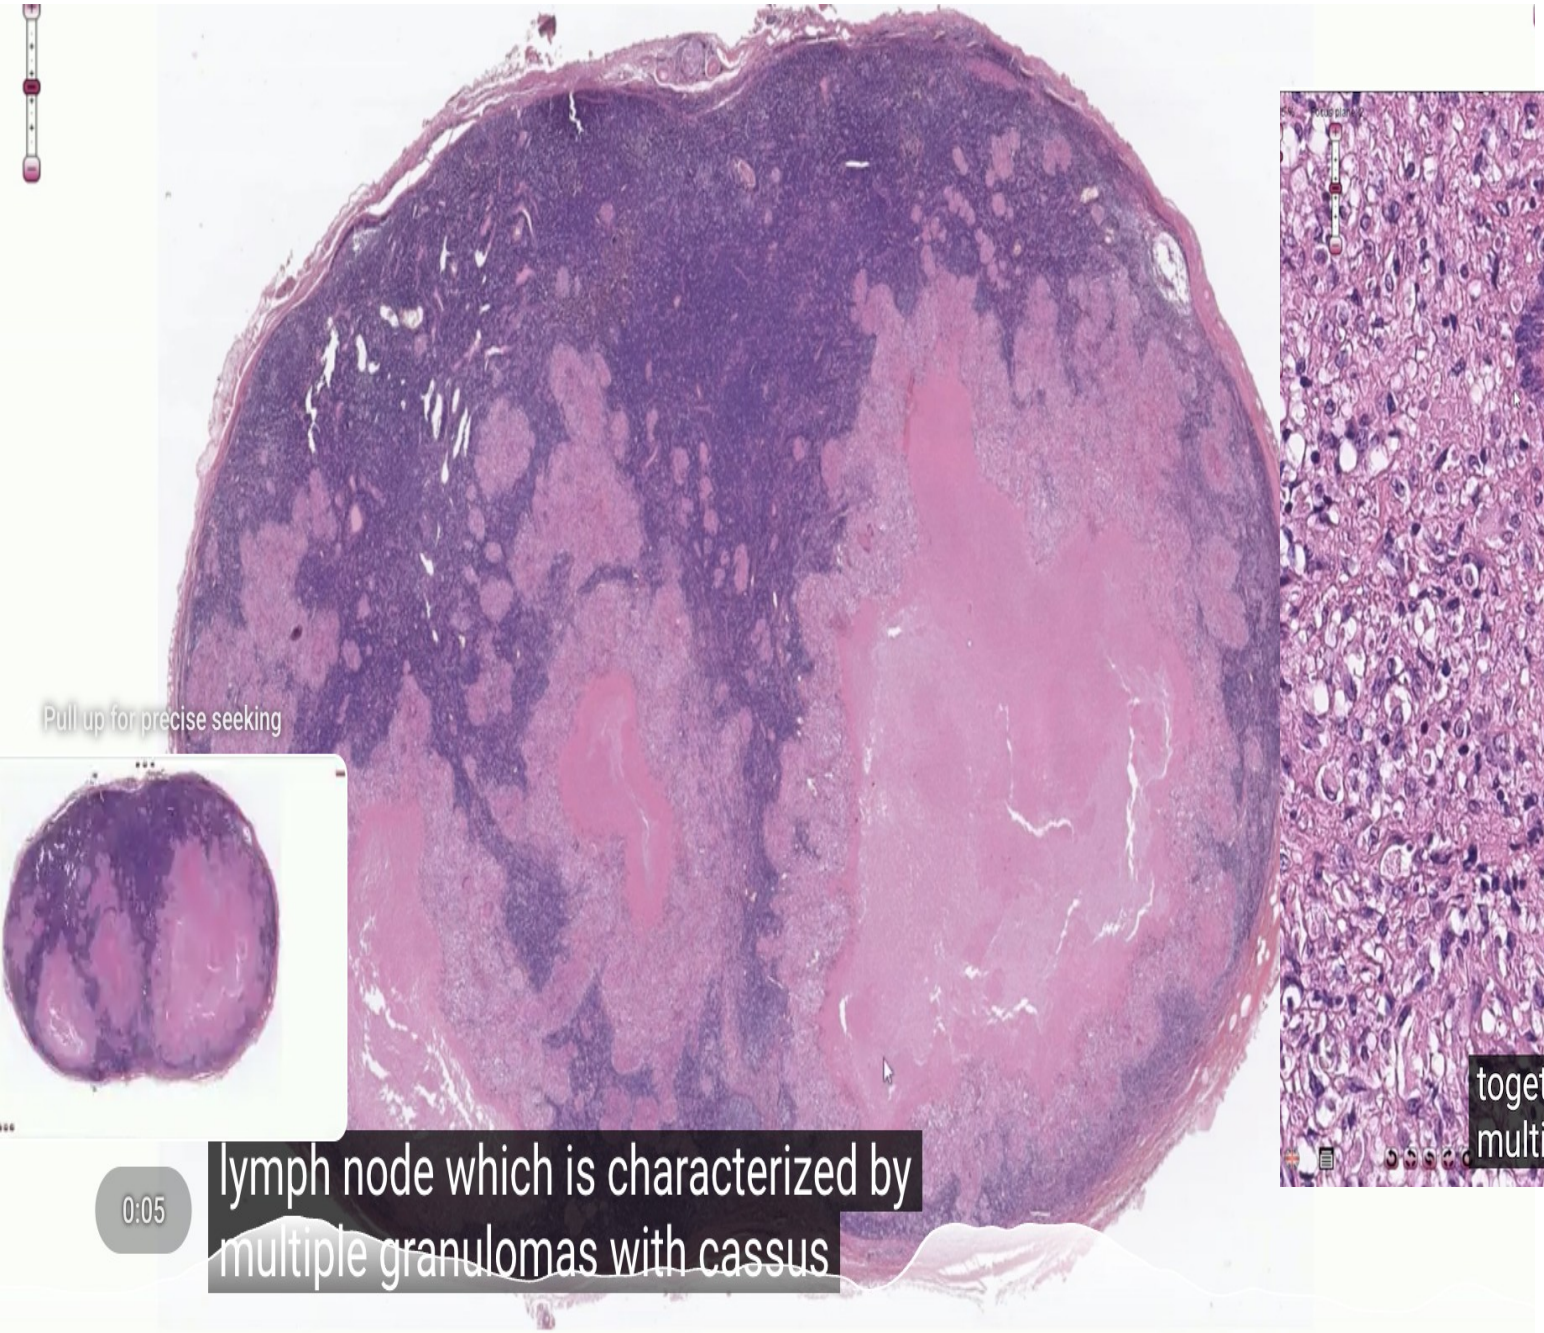

Collar of lymphocytes surrounding epitheloid cell aggregates

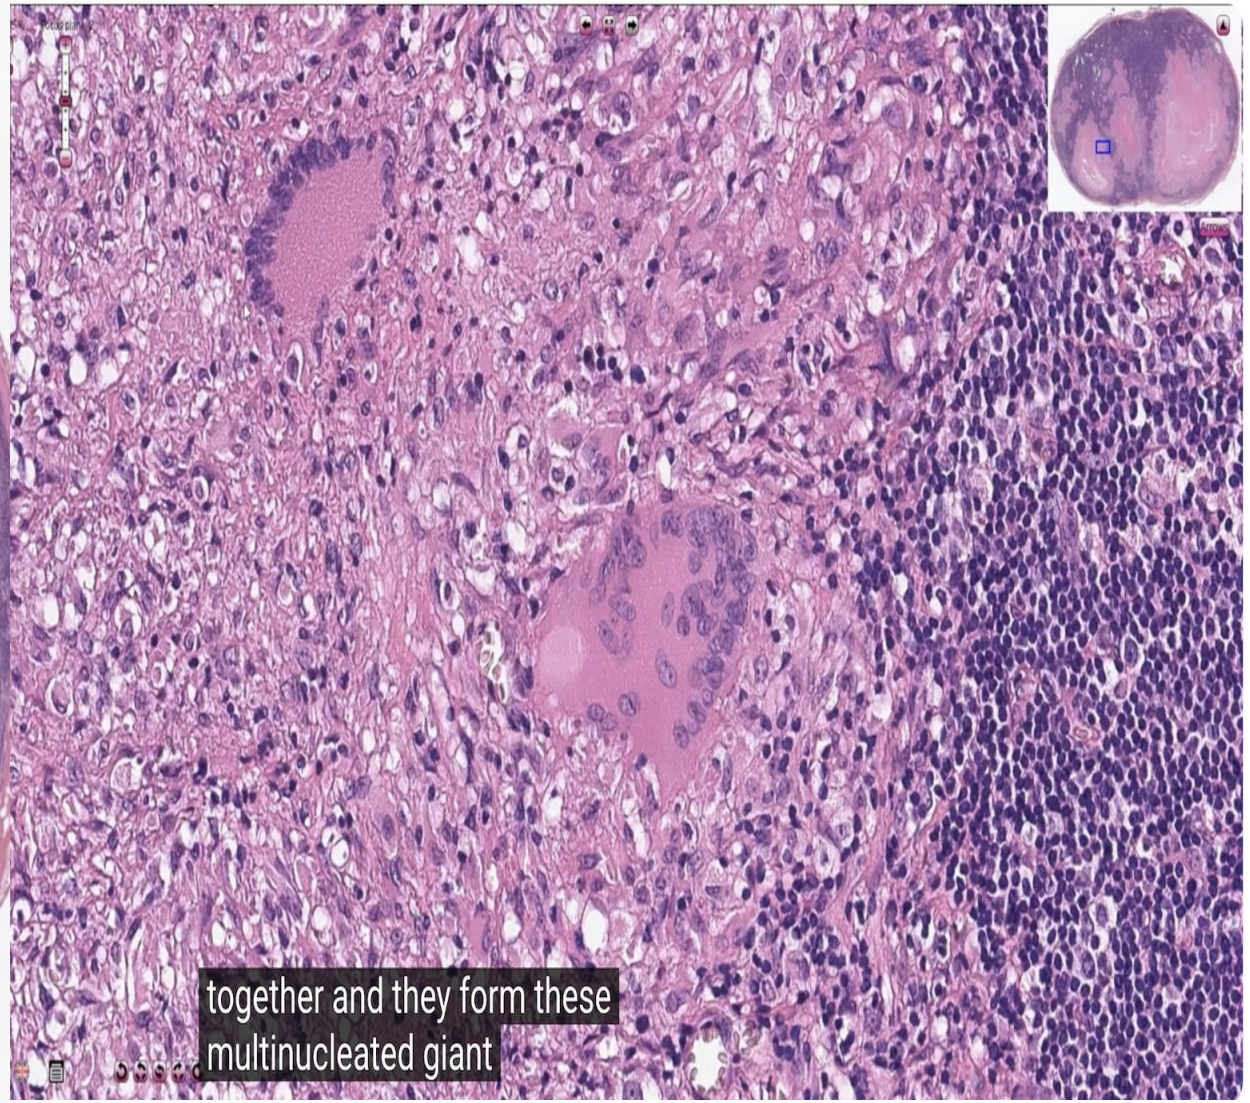

TB granuloma

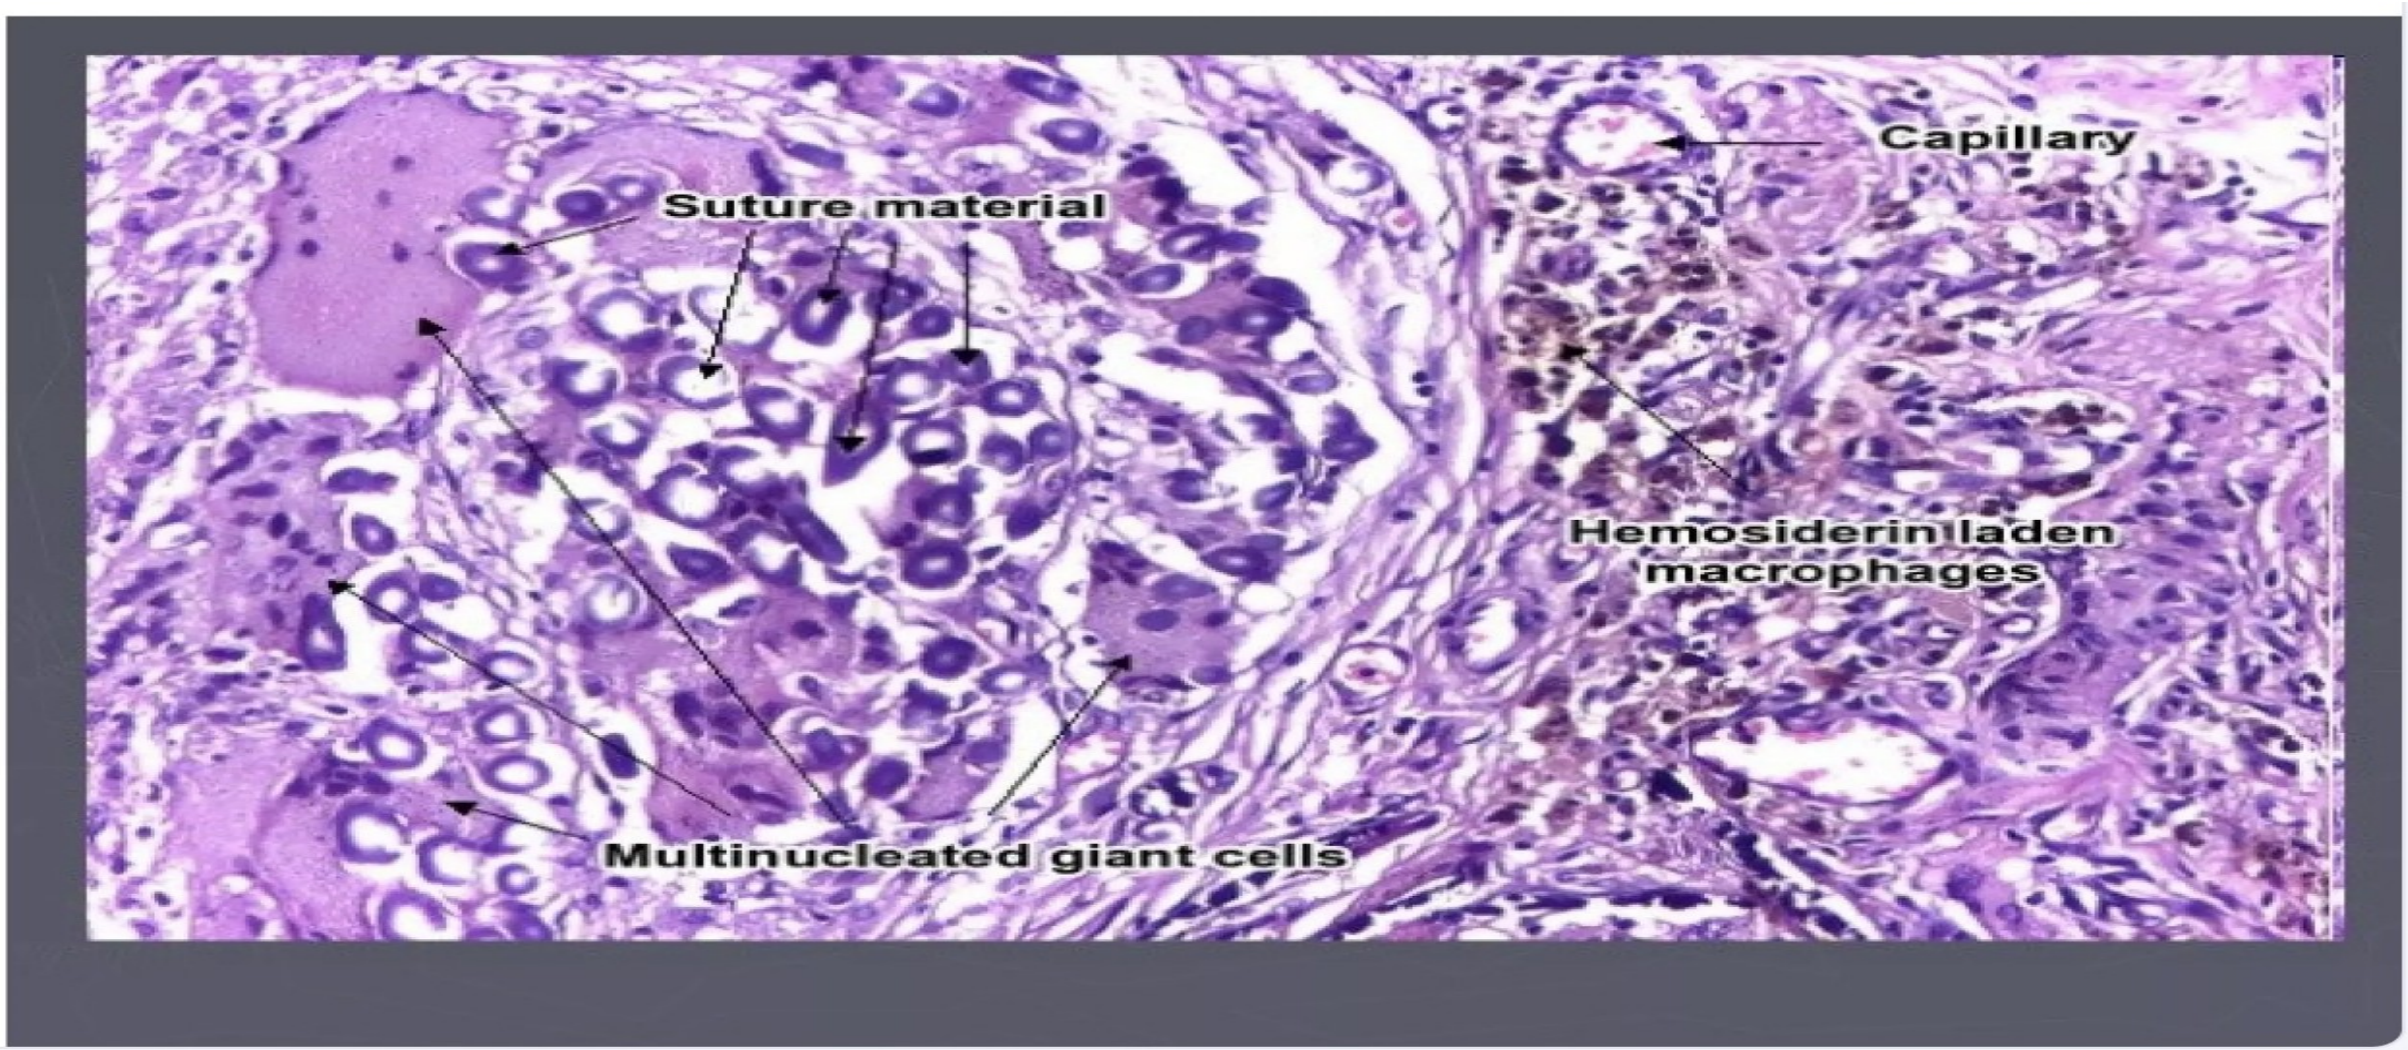

M/F granuloma

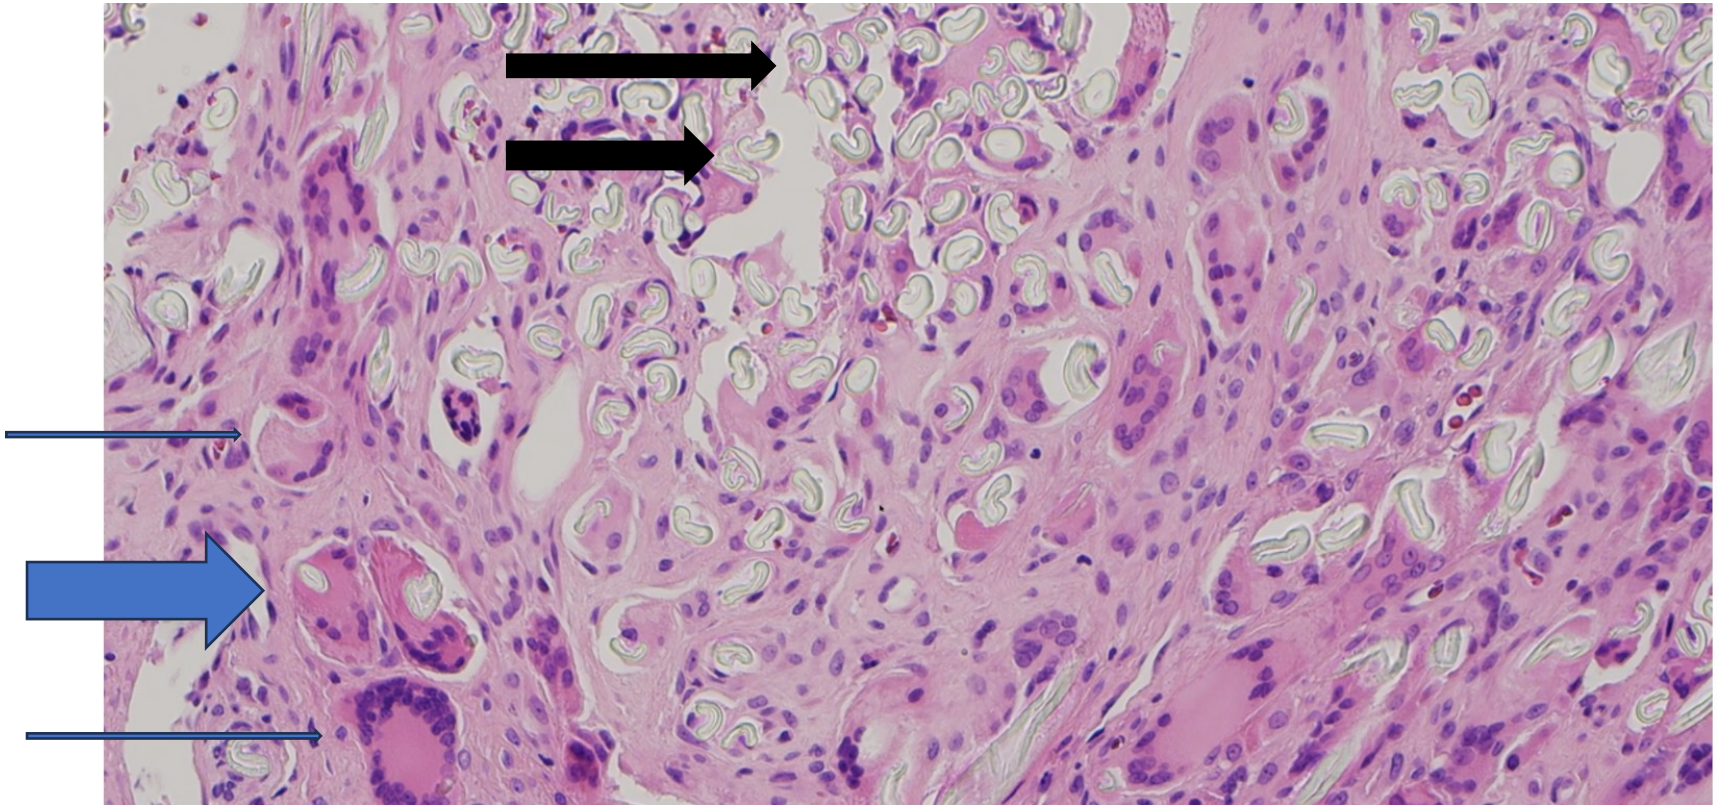

Pull up for precise seeking
0:05
lymph node which is characterized by
multiple granulomas with cassus

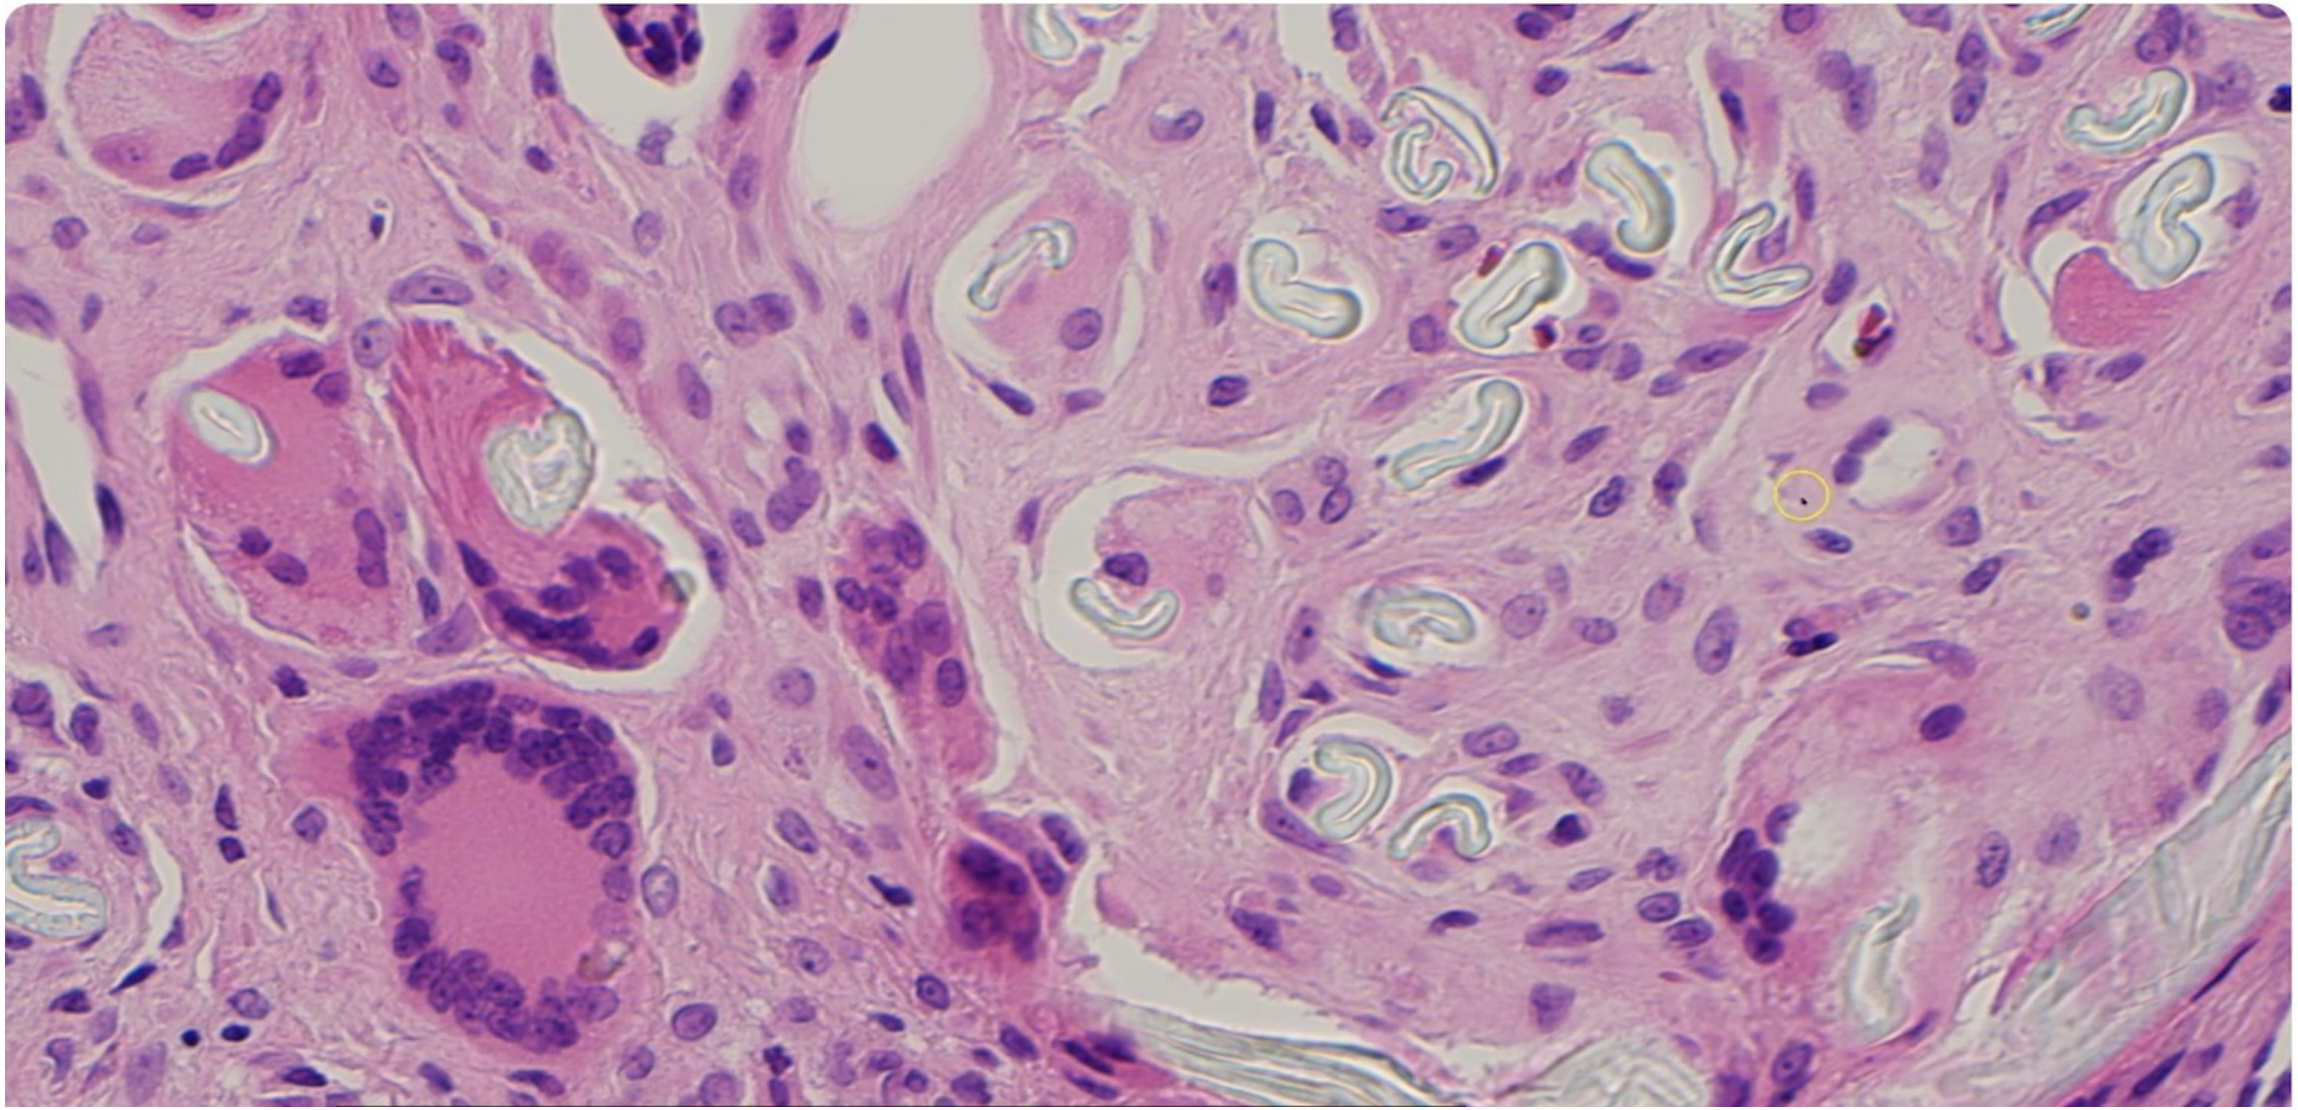

together and they form these
multinucleated giant

Foreign body giant cell

42 years old male with toe amputation

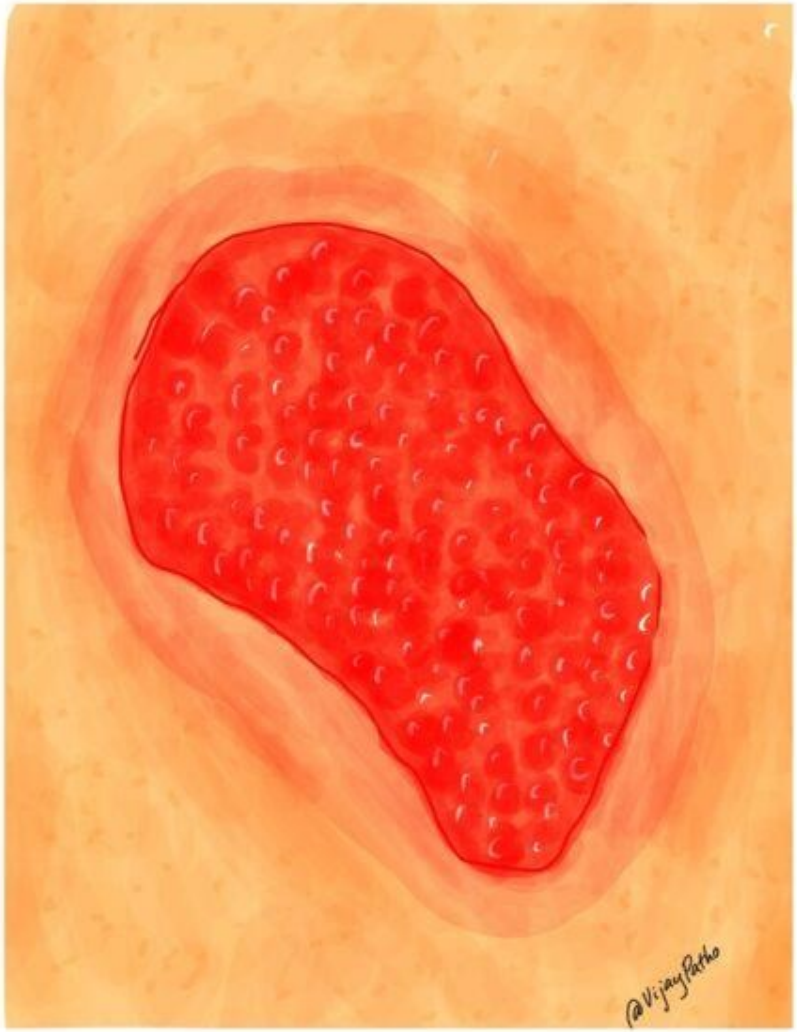

Foreign body giant cells around a gauze material+ its refractile material

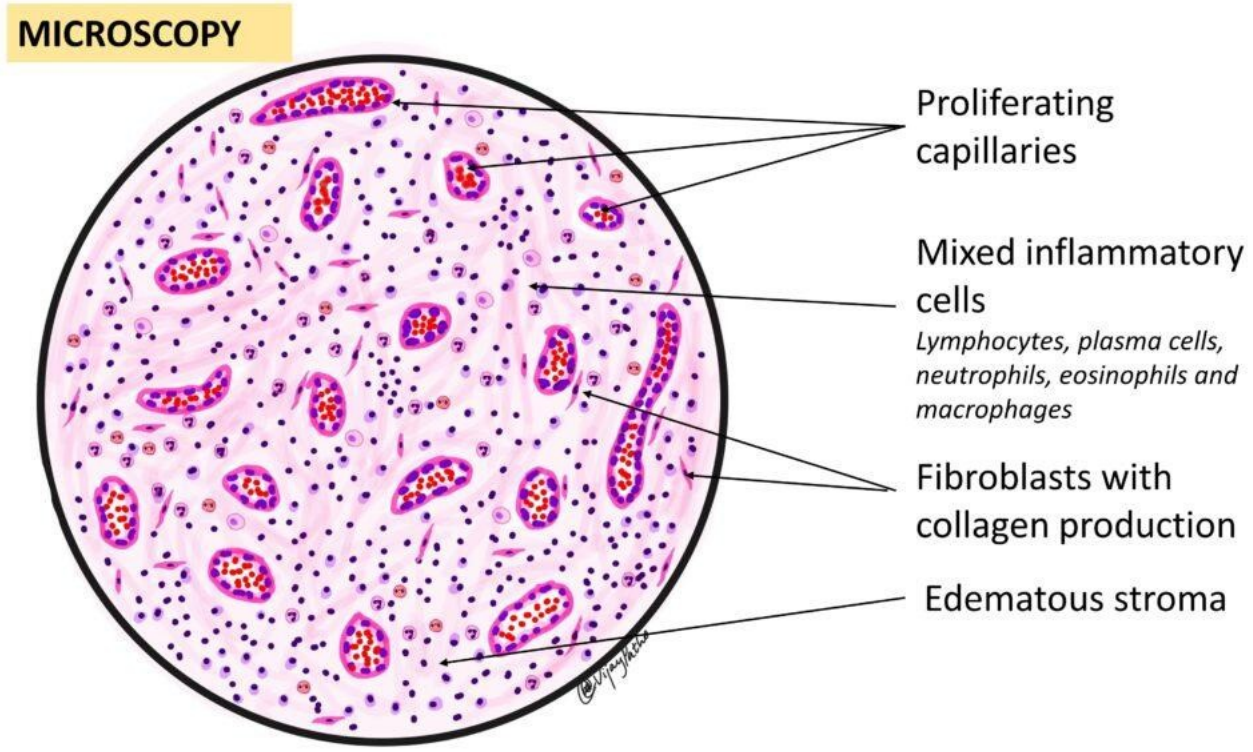

- Healing and repair

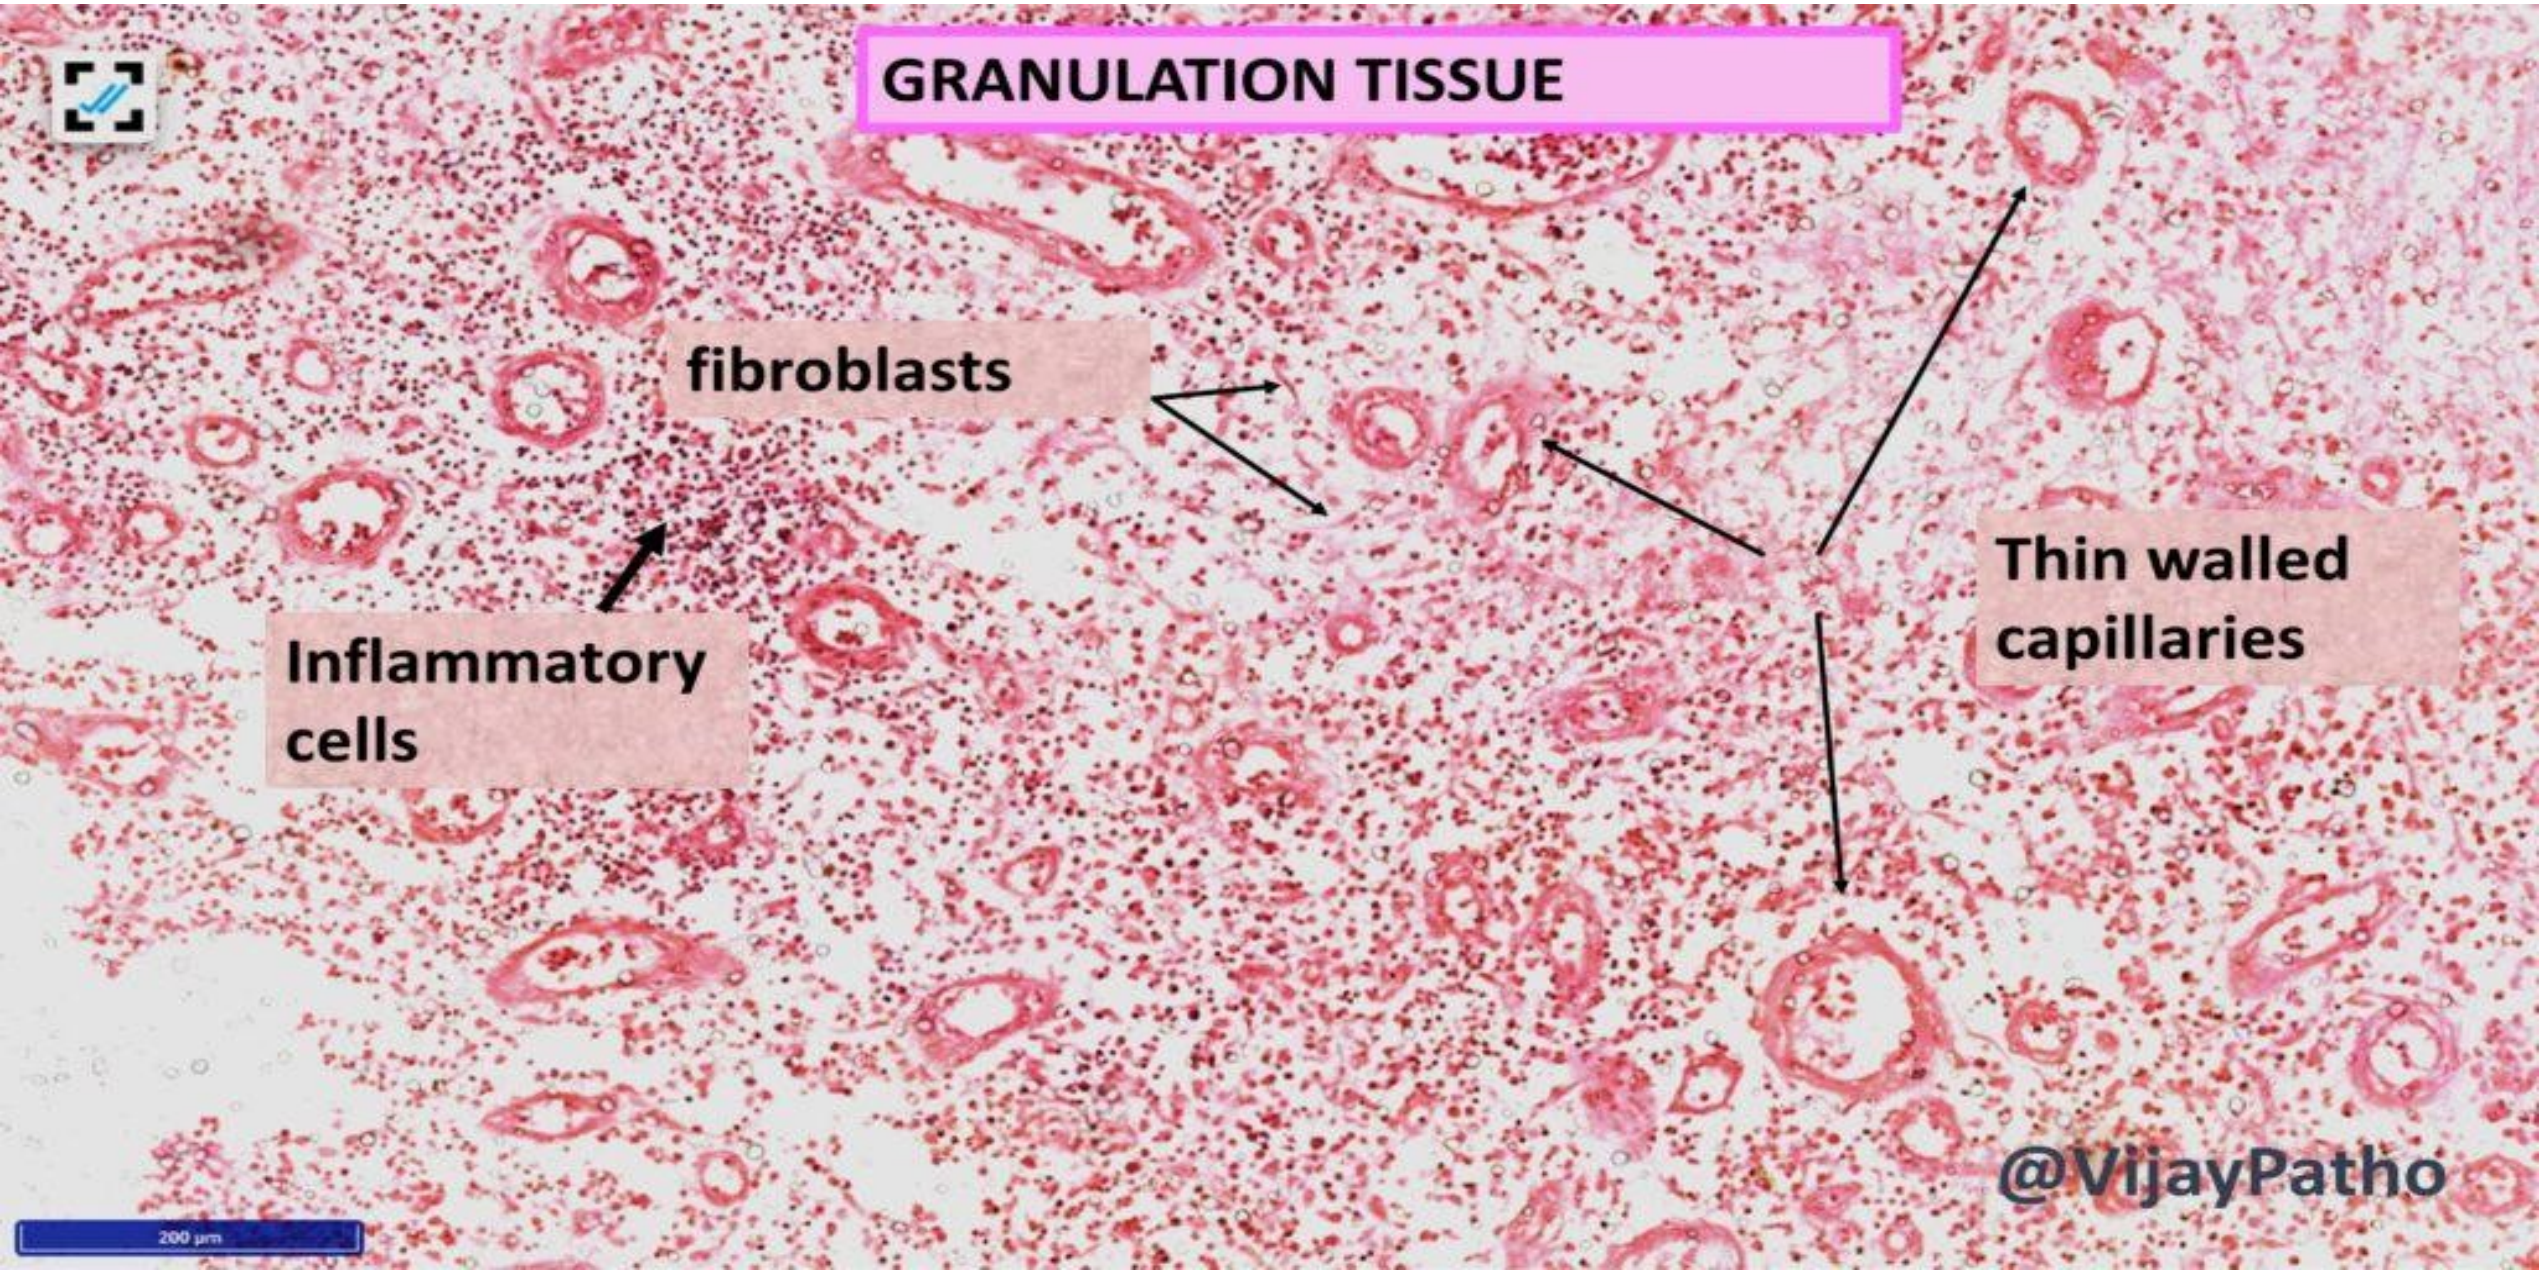

Granulation tissue

GROSS	
Color	Pink to red
Texture	Granular/ small grains
Consistency	Soft to firm
Shape	Fills the wound/ shape of wound
Bleeding tendency	Can bleed easily with minor trauma

Granulation tissue

GRANULATION TISSUE
fibroblasts
Inflammatory cells
Thin walled capillaries

Wound healing

first intention healing

second intention healing

Complications of wound healing

Wound Contracture

Hypertrophic scar

Keloid formation

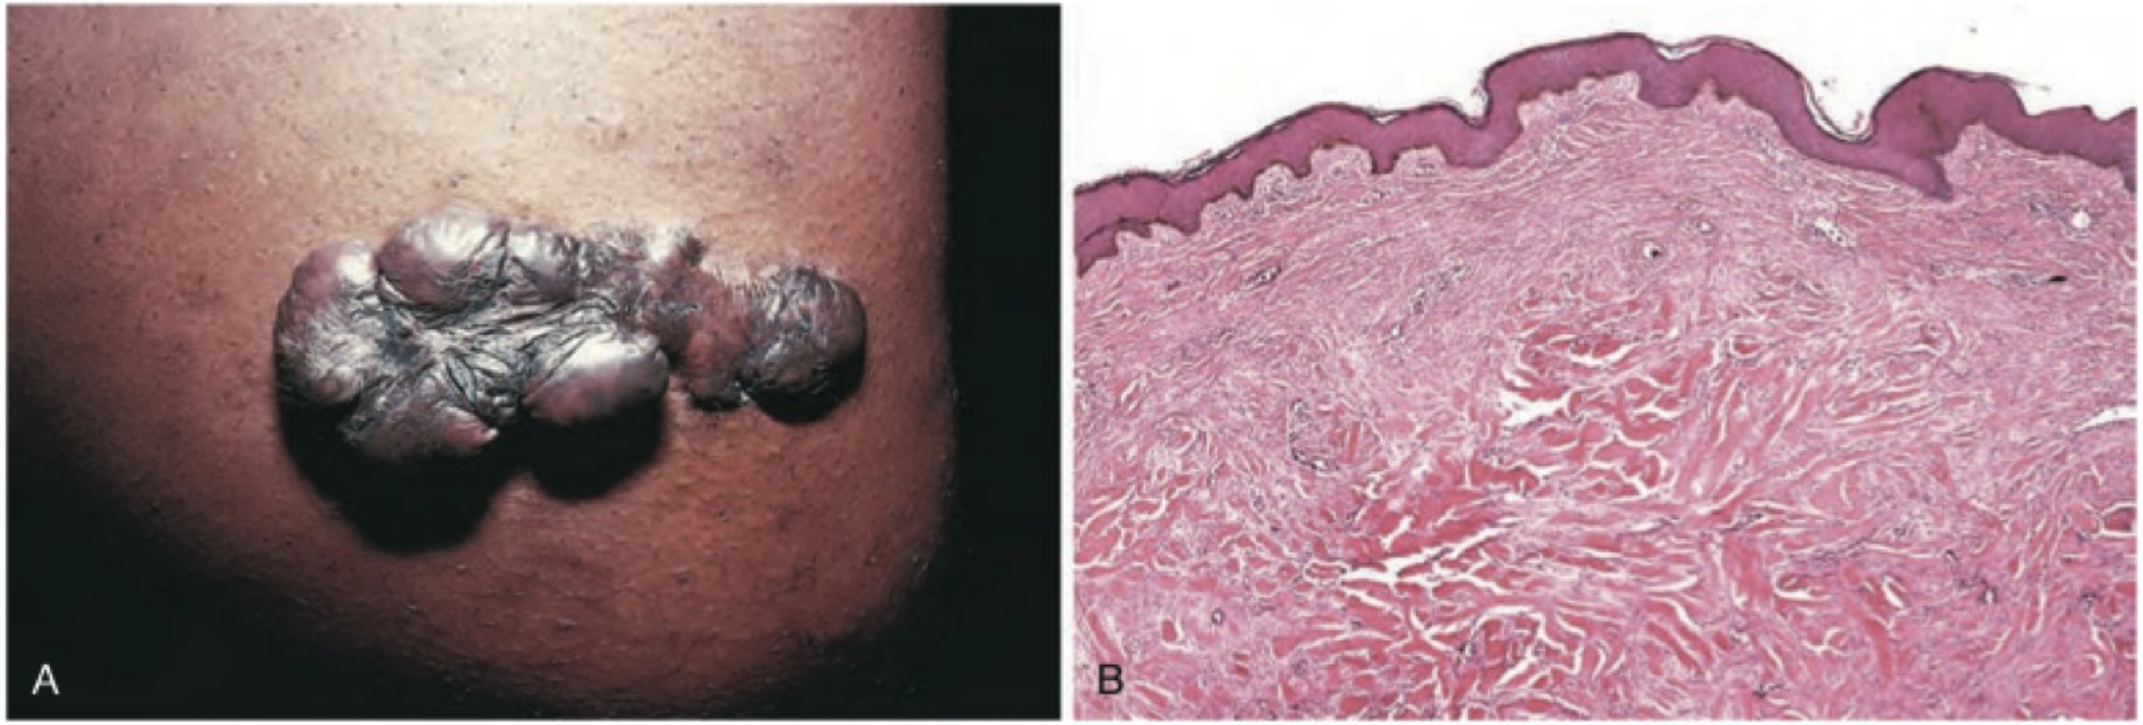

Figure 3-32 Keloid. **A,** Excess collagen deposition in the skin forming a raised scar known as *keloid*. **B,** Note the thick connective tissue deposition in the dermis. (**A,** From Murphy GF, Herzberg AJ: Atlas of Dermatopathology. Philadelphia, WB Saunders, 1996, p 219; **B,** Courtesy Z. Argenyi, MD, University of Washington, Seattle, Wash.)

Incisional hernia
